1 Introduction

The `fmtcount` package provides commands to display the values of \LaTeX counters in a variety of formats. It also provides equivalent commands for actual numbers rather than counter names. Limited multilingual support is available. Currently, there is only support for English, French (including Belgian and Swiss variations), Spanish, Portuguese, German and Italian.

2 Available Commands

The commands can be divided into two categories: those that take the name of a counter as the argument, and those that take a number as the argument.

`\ordinal` `\ordinal{<counter>}[<gender>]`

This will print the value of a \LaTeX counter `<counter>` as an ordinal, where the macro

`\fmtord` `\fmtord{<text>}`

is used to format the st, nd, rd, th bit. By default the ordinal is formatted as a superscript, if the package option `level` is used, it is level with the text. For example, if the current section is 2, then `\ordinal{section}` will produce the output: 2nd. Note that the optional argument `<gender>` occurs *at the end*. This argument may only take one of the following values: m (masculine), f (feminine) or n (neuter.) If `<gender>` is omitted, or if the given gender has no meaning in the current language, m is assumed.

Notes:

1. the memoir class also defines a command called `\ordinal` which takes a number as an argument instead of a counter. In order to overcome this incompatibility, if you want to use the `fmtcount` package with the memoir class you should use

`\FCordinal`

```
\FCordinal
```

to access `fmtcount`'s version of `\ordinal`, and use `\ordinal` to use memoir's version of that command.

2. When the [`<gender>`] optional argument is omitted, no ignoring of spaces following the final argument occurs. So both `\ordinal{section}_!` and `\ordinal{section}[m]_!` will produce: 2nd_, where _ denotes a space. See § 7.1.

The commands below only work for numbers in the range 0 to 99999.

`\ordinalnum`

```
\ordinalnum{<n>}[<gender>]
```

This is like `\ordinal` but takes an actual number rather than a counter as the argument. For example: `\ordinalnum{2}` will produce: 2nd.

`\numberstring`

```
\numberstring{<counter>}[<gender>]
```

This will print the value of `<counter>` as text. E.g. `\numberstring{section}` will produce: three. The optional argument is the same as that for `\ordinal`.

`\Numberstring`

```
\Numberstring{<counter>}[<gender>]
```

This does the same as `\numberstring`, but with initial letters in uppercase. For example, `\Numberstring{section}` will produce: Two.

`\NUMBERstring`

```
\NUMBERstring{<counter>}[<gender>]
```

This does the same as `\numberstring`, but converts the string to upper case. Note that `\MakeUppercase{\NUMBERstring{<counter>}}` doesn't work, due to the way that `\MakeUppercase` expands its argument¹.

`\numberstringnum`

```
\numberstringnum{<n>}[<gender>]
```

`\Numberstringnum`

```
\Numberstringnum{<n>}[<gender>]
```

`\NUMBERstringnum`

```
\NUMBERstringnum{<n>}[<gender>]
```

¹See all the various postings to `comp.text.tex` about `\MakeUppercase`

These macros work like `\numberstring`, `\Numberstring` and `\NUMBERstring`, respectively, but take an actual number rather than a counter as the argument. For example: `\Numberstringnum{105}` will produce: One Hundred and Five.

`\ordinalstring` `\ordinalstring{<counter>}[<gender>]`

This will print the value of `<counter>` as a textual ordinal. E.g. `\ordinalstring{section}` will produce: third. The optional argument is the same as that for `\ordinal`.

`\Ordinalstring` `\Ordinalstring{<counter>}[<gender>]`

This does the same as `\ordinalstring`, but with initial letters in uppercase. For example, `\Ordinalstring{section}` will produce: Second.

`\ORDINALstring` `\ORDINALstring{<counter>}[<gender>]`

This does the same as `\ordinalstring`, but with all words in upper case (see previous note about `\MakeUppercase`).

`rdinalstringnum` `\ordinalstringnum{<n>}[<gender>]`

`rdinalstringnum` `\Ordinalstringnum{<n>}[<gender>]`

`RDINALstringnum` `\ORDINALstringnum{<n>}[<gender>]`

These macros work like `\ordinalstring`, `\Ordinalstring` and `\ORDINALstring`, respectively, but take an actual number rather than a counter as the argument. For example, `\ordinalstringnum{2}` will produce: second.

As from version 1.09, textual representations can be stored for later use. This overcomes the problems encountered when you attempt to use one of the above commands in `\edef`.

Each of the following commands takes a label as the first argument, the other arguments are as the analogous commands above. These commands do not display anything, but store the textual representation. This can later be retrieved using

`\FMCuse` `\FMCuse{<label>}`

Note: with `\storeordinal` and `\storeordinalnum`, the only bit that doesn't get expanded is `\fmtord`. So, for example, `\storeordinalnum{mylabel}{3}` will be stored as `3\relax \fmtord{rd}`.

<code>\storeordinal</code>	<code>\storeordinal{<label>}{<counter>}[<gender>]</code>
<code>preordinalstring</code>	<code>\storeordinalstring{<label>}{<counter>}[<gender>]</code>
<code>preOrdinalstring</code>	<code>\storeOrdinalstring{<label>}{<counter>}[<gender>]</code>
<code>preORDINALstring</code>	<code>\storeORDINALstring{<label>}{<counter>}[<gender>]</code>
<code>prenumberstring</code>	<code>\storenumberstring{<label>}{<counter>}[<gender>]</code>
<code>preNumberstring</code>	<code>\storeNumberstring{<label>}{<counter>}[<gender>]</code>
<code>preNUMBERstring</code>	<code>\storeNUMBERstring{<label>}{<counter>}[<gender>]</code>
<code>storeordinalnum</code>	<code>\storeordinalnum{<label>}{<number>}[<gender>]</code>
<code>preordinalstringnum</code>	<code>\storeordinalstring{<label>}{<number>}[<gender>]</code>
<code>preOrdinalstringnum</code>	<code>\storeOrdinalstringnum{<label>}{<number>}[<gender>]</code>
<code>preORDINALstringnum</code>	<code>\storeORDINALstringnum{<label>}{<number>}[<gender>]</code>
<code>prenumberstringnum</code>	<code>\storenumberstring{<label>}{<number>}[<gender>]</code>
<code>preNumberstringnum</code>	<code>\storeNumberstring{<label>}{<number>}[<gender>]</code>
<code>preNUMBERstringnum</code>	<code>\storeNUMBERstring{<label>}{<number>}[<gender>]</code>

`\binary` `\binary{<counter>}`

This will print the value of *<counter>* as a binary number. E.g. `\binary{section}` will produce: 10. The declaration

`\padzeroes` `\padzeroes[<n>]`

will ensure numbers are written to *<n>* digits, padding with zeroes if necessary. E.g. `\padzeroes[8]\binary{section}` will produce: 00000010. The default value for *<n>* is 17.

`\binarynum` `\binary{<n>}`

This is like `\binary` but takes an actual number rather than a counter as the argument. For example: `\binarynum{5}` will produce: 101.

The octal commands only work for values in the range 0 to 32768.

`\octal` `\octal{<counter>}`

This will print the value of *<counter>* as an octal number. For example, if you have a counter called, say `mycounter`, and you set the value to 125, then `\octal{mycounter}` will produce: 177. Again, the number will be padded with zeroes if necessary, depending on whether `\padzeroes` has been used.

`\octalnum` `\octalnum{<n>}`

This is like `\octal` but takes an actual number rather than a counter as the argument. For example: `\octalnum{125}` will produce: 177.

`\hexadecimal` `\hexadecimal{<counter>}`

This will print the value of *<counter>* as a hexadecimal number. Going back to the counter used in the previous example, `\hexadecimal{mycounter}` will produce: 7d. Again, the number will be padded with zeroes if necessary, depending on whether `\padzeroes` has been used.

`\HEXADecimal` `\HEXADecimal{<counter>}`

This does the same thing, but uses uppercase characters, e.g. `\HEXADecimal{mycounter}` will produce: 7D.

`\Hexadecimal` The macro `\Hexadecimal` is a deprecated alias of `\HEXADecimal`. Its name was confusing so it was changed. See [7.2](#).

`\hexadecimalnum` `\hexadecimalnum{<n>}`

`\HEXADecimalnum`

```
\HEXADecimalnum{<n>}
```

These are like `\hexadecimal` and `\Hexadecimal` but take an actual number rather than a counter as the argument. For example: `\hexadecimalnum{125}` will produce: 7d, and `\HEXADecimalnum{125}` will produce: 7D.

`\Hexadecimalnum`

The macro `\Hexadecimalnum` is a deprecated alias of `\HEXADecimalnum`. Its name was confusing so it was changed. See [7.2](#).

`\decimal`

```
\decimal{<counter>}
```

This is similar to `\arabic` but the number can be padded with zeroes depending on whether `\padzeroes` has been used. For example: `\padzeroes[8]\decimal{section}` will produce: 00000002 still assuming current section is section 2.

`\decimalnum`

```
\decimalnum{<n>}
```

This is like `\decimal` but takes an actual number rather than a counter as the argument. For example: `\padzeroes[8]\decimalnum{5}` will produce: 00000005.

`\aaalph`

```
\aaalph{<counter>}
```

This will print the value of `<counter>` as: a b ... z aa bb ... zz etc. For example, `\aaalpha{mycounter}` will produce: uuuuu if `mycounter` is set to 125.

`\AAAAlph`

```
\AAAAlph{<counter>}
```

This does the same thing, but uses uppercase characters, e.g. `\AAAAlph{mycounter}` will produce: UUUUU.

`\aaalphnum`

```
\aaalphnum{<n>}
```

`\AAAAlphnum`

```
\AAAAlphnum{<n>}
```

These macros are like `\aaalph` and `\AAAAlph` but take an actual number rather than a counter as the argument. For example: `\aaalphnum{125}` will produce: uuuuu, and `\AAAAlphnum{125}` will produce: UUUUU.

The `abalph` commands described below only work for values in the range 0 to 17576.

`\abalph`

```
\abalph{<counter>}
```

This will print the value of `<counter>` as: a b ... z aa ab ... az etc. For example, `\abalpha{mycounter}` will produce: du if `mycounter` is set to 125.

`\ABAlph` `\ABAlph{<counter>}`

This does the same thing, but uses uppercase characters, e.g. `\ABAlph{mycounter}` will produce: DU.

`\abalphnum` `\abalphnum{<n>}`

`\ABAlphnum` `\ABAlphnum{<n>}`

These macros are like `\abalph` and `\ABAlph` but take an actual number rather than a counter as the argument. For example: `\abalphnum{125}` will produce: du, and `\ABAlphnum{125}` will produce: DU.

3 Package Options

The following options can be passed to this package:

`<dialect>` load language `<dialect>`, supported `<dialect>` are the same as passed to `\FCloadlang`, see 4

`raise` make ordinal st,nd,rd,th appear as superscript

`level` make ordinal st,nd,rd,th appear level with rest of text

Options `raise` and `level` can also be set using the command:

`countsetoptions` `\fmtcountsetoptions{fmtord=<type>}`

where `<type>` is either `level` or `raise`. Since version 3.01 of `fmtcount`, it is also possible to set `<type>` on a language by language basis, see § 4.

4 Multilingual Support

Version 1.02 of the `fmtcount` package now has limited multilingual support. The following languages are implemented: English, Spanish, Portuguese, French, French (Swiss) and French (Belgian). German support was added in version 1.1.² Italian support was added in version 1.31.³

Actually, `fmtcount` has two modes:

- a multilingual mode, in which the commands `\numberstring`, `\ordinalstring`, `\ordinal`, and their variants will be formatted in the currently selected language, as per the `\language` macro set by `babel`, `polyglossia` or `suchlikes`, and

²Thanks to K. H. Fricke for supplying the information.

³Thanks to Edoardo Pasca for supplying the information.

- a default mode for backward compatibility in which these commands are formatted in English irrespective of `\languagename`, and to which `fmtcount` falls back when it cannot detect packages such as `babel` or `polyglossia` are loaded.

For multilingual mode, `fmtcount` needs to load correctly the language definition for document dialects. To do this use

`\FCloadlang`

```
\FCloadlang{<dialect>}
```

in the preamble — this will both switch on multilingual mode, and load the `<dialect>` definition. The `<dialect>` should match the options passed to `babel` or `polyglossia`. `fmtcount` currently supports the following `<dialect>`'s: `english`, `UKenglish`, `brazilian`, `british`, `USenglish`, `american`, `spanish`, `portuges`, `portuguese`, `french`, `frenchb`, `francais`, `german`, `germanb`, `ngerman`, `ngermanb`, and `italian`.

If you don't use `\FCloadlang`, `fmtcount` will attempt to detect the required dialects and call `\FCloadlang` for you, but this isn't guaranteed to work. Notably, when `\FCloadlang` is not used and `fmtcount` has switched on multilingual mode, but without detecting the needed dialects in the preamble, and `fmtcount` has to format a number for a dialect for which definition has not been loaded (via `\FCloadlang` above), then if `fmtcount` detects a definition file for this dialect it will attempt to load it, and cause an error otherwise. This loading in body has not been tested extensively, and may cause problems such as spurious spaces insertion before the first formatted number, so it's best to use `\FCloadlang` explicitly in the preamble.

If the French language is selected, the `french` option let you configure the dialect and other aspects. The `abbr` also has some influence with French. Please refer to § 4.2.

The male gender for all languages is used by default, however the feminine or neuter forms can be obtained by passing `f` or `n` as an optional argument to `\ordinal`, `\ordinalnum` etc. For example: `\numberstring{section}[f]`. Note that the optional argument comes *after* the compulsory argument. If a gender is not defined in a given language, the masculine version will be used instead.

Let me know if you find any spelling mistakes (has been known to happen in English, let alone other languages with which I'm not so familiar.) If you want to add support for another language, you will need to let me know how to form the numbers and ordinals from 0 to 99999 in that language for each gender.

4.1 Options for setting ordinal ending position raise/level

`countsetoptions`

```
\fmtcountsetoptions{<language>={fmtord=<type>}}
```

where `<language>` is one of the supported language `<type>` is either `level` or `raise` or `undefine`. If the value is `level` or `raise`, then that will set the `fmtord` option accordingly⁴ only for that language `<language>`. If the value is `undefine`, then the non-language specific behaviour is followed.

⁴see § 3

Some *<language>* are synonyms, here is a table:

language	alias(es)
english	british
french	frenchb
german	germanb ngerman ngermanb
USenglish	american

4.2 Options for French

This section is in French, as it is most useful to French speaking people.

Il est possible de configurer plusieurs aspects de la numérotation en français avec les options french et abbr. Ces options n'ont d'effet que si le langage french est chargé.

countsetoptions

```
\fmtcountsetoptions{french={french options}}
```

L'argument *<french options>* est une liste entre accolades et séparée par des virgules de réglages de la forme "*<clef>=<valeur>*", chacun de ces réglages est ci-après désigné par "option française" pour le distinguer des "options générales" telles que french.

Le dialecte peut être sélectionné avec l'option française dialect dont la valeur *<dialect>* peut être france, belgian ou swiss.

dialect

```
\fmtcountsetoptions{french={dialect={dialect}}}
```

french

```
\fmtcountsetoptions{french={dialect}}
```

Pour alléger la notation et par souci de rétro-compatibilité france, belgian ou swiss sont également des *<clef>*s pour *<french options>* à utiliser sans *<valeur>*.

L'effet de l'option dialect est illustré ainsi :

france soixante-dix pour 70, quatre-vingts pour 80, et quatre-vingts-dix pour 90,

belgian septante pour 70, quatre-vingts pour 80, et nonante pour 90,

swiss septante pour 70, huitante⁵ pour 80, et nonante pour 90

Il est à noter que la variante belgian est parfaitement correcte pour les francophones français⁶, et qu'elle est également utilisée en Suisse Romande hormis dans les cantons de Vaud, du Valais et de Fribourg. En ce qui concerne le mot "octante", il n'est actuellement pas pris en charge et n'est guère plus utilisé, ce qui est sans doute dommage car il est sans doute plus acceptable que le "huitante" de certains de nos amis suisses.

abbr

```
\fmtcountsetoptions{abbr={boolean}}
```

⁵voir [Octante et huitante](#) sur le site d'Alain Lassine

⁶je précise que l'auteur de ces lignes est français

L'option générale `abbr` permet de changer l'effet de `\ordinal`. Selon $\langle boolean \rangle$ on a :
`true` pour produire des ordinaux de la forme 2^e (par défaut), ou
`false` pour produire des ordinaux de la forme 2^{ème}

vingt plural `\fmtcountsetoptions{french={vingt plural=french plural control}}`

cent plural `\fmtcountsetoptions{french={cent plural=french plural control}}`

mil plural `\fmtcountsetoptions{french={mil plural=french plural control}}`

n-illion plural `\fmtcountsetoptions{french={n-illion plural=french plural control}}`

n-illiard plural `\fmtcountsetoptions{french={n-illiard plural=french plural control}}`

all plural `\fmtcountsetoptions{french={all plural=french plural control}}`

Les options `vingt plural`, `cent plural`, `mil plural`, `n-illion plural`, et `n-illiard plural`, permettent de contrôler très finement l'accord en nombre des mots respectivement vingt, cent, mil, et des mots de la forme $\langle n \rangle$ illion et $\langle n \rangle$ illiard, où $\langle n \rangle$ désigne 'm' pour 1, 'b' pour 2, 'tr' pour 3, etc. L'option `all plural` est un raccourci permettant de contrôler de concert l'accord en nombre de tous ces mots. Tous ces paramètres valent `reformed` par défaut.

Attention, comme on va l'expliquer, seules quelques combinaisons de configurations de ces options donnent un orthographe correcte vis à vis des règles en vigueur. La raison d'être de ces options est la suivante :

- la règle de l'accord en nombre des noms de nombre dans un numéral cardinal dépend de savoir s'il a vraiment une valeur cardinale ou bien une valeur ordinale, ainsi on écrit « aller à la page deux-cent (sans s) d'un livre de deux-cents (avec s) pages », il faut donc pouvoir changer la configuration pour sélectionner le cas considéré,
- un autre cas demandant quelque configurabilité est celui de « mil » et « mille ». Pour rappel « mille » est le pluriel irrégulier de « mil », mais l'alternance mil/mille est rare, voire pédante, car aujourd'hui « mille » n'est utilisé que comme un mot invariable, en effet le sort des pluriels étrangers est systématiquement de finir par disparaître comme par exemple « scénarii » aujourd'hui supplanté par « scénarios ». Pour continuer à pouvoir écrire « mil », il aurait fallu former le pluriel comme « mils », ce qui n'est pas l'usage. Certaines personnes utilisent toutefois encore « mil » dans les dates, par exemple « mil neuf cent quatre-vingt quatre » au lieu de « mille neuf cent quatre-vingt quatre »,

- finalement les règles du français quoique bien définies ne sont pas très cohérentes et il est donc inévitable qu'un jour ou l'autre on les simplifie. Le paquetage `fmtcount` est déjà prêt à cette éventualité.

Le paramètre `<french plural control>` peut prendre les valeurs suivantes :

<code>traditional</code>	pour sélectionner la règle en usage chez les adultes à la date de parution de ce document, et dans le cas des numéraux cardinaux, lorsqu'ils ont une valeur cardinale,
<code>reformed</code>	pour suivre toute nouvelle recommandation à la date de parution de ce document, , et dans le cas des numéraux cardinaux, lorsqu'ils ont une valeur cardinale, l'idée des options <code>traditional</code> et <code>reformed</code> est donc de pouvoir contenter à la fois les anciens et les modernes, mais à dire vrai à la date où ce document est écrit elles ont exactement le même effet,
<code>traditional o</code>	pareil que <code>traditional</code> mais dans le cas des numéraux cardinaux, lorsqu'ils ont une valeur ordinale,
<code>reformed o</code>	pareil que <code>reformed</code> mais dans le cas des numéraux cardinaux, lorsqu'ils ont une valeur ordinale, de même que précédemment <code>reformed o</code> et <code>traditional o</code> ont exactement le même effet,
<code>always</code>	pour marquer toujours le pluriel, ceci n'est correct que pour « mil » vis à vis des règles en vigueur,
<code>never</code>	pour ne jamais marquer le pluriel, ceci est incorrect vis à vis des règles d'orthographe en vigueur,
<code>multiple</code>	pour marquer le pluriel lorsque le nombre considéré est multiplié par au moins 2, ceci est la règle en vigueur pour les nombres de la forme $\langle n \rangle$ illion et $\langle n \rangle$ illiard lorsque le nombre a une valeur cardinale,
<code>multiple g-last</code>	pour marquer le pluriel lorsque le nombre considéré est multiplié par au moins 2 est est <i>globalement</i> en dernière position, où "globalement" signifie qu'on considère le nombre formaté en entier, ceci est incorrect vis à vis des règles d'orthographe en vigueur,
<code>multiple l-last</code>	pour marquer le pluriel lorsque le nombre considéré est multiplié par au moins 2 et est <i>localement</i> en dernière position, où "localement" signifie qu'on considère seulement la portion du nombre qui multiplie soit l'unité, soit un $\langle n \rangle$ illion ou un $\langle n \rangle$ illiard; ceci est la convention en vigueur pour le pluriel de "vingt" et de "cent" lorsque le nombre formaté a une valeur cardinale,

- multiple lng-last pour marquer le pluriel lorsque le nombre considéré est multiplié par au moins 2 et est *localement* mais *non globalement* en dernière position, où “localement” et *globalement* on la même signification que pour les options multiple g-last et multiple l-last; ceci est la convention en vigueur pour le pluriel de “vingt” et de “cent” lorsque le nombre formaté a une valeur ordinale,
- multiple ng-last pour marquer le pluriel lorsque le nombre considéré est multiplié par au moins 2, et *n*’est pas *globalement* en dernière position, où “globalement” a la même signification que pour l’option multiple g-last; ceci est la règle que j’inferè être en vigueur pour les nombres de la forme $\langle n \rangle$ illion et $\langle n \rangle$ illiard lorsque le nombre a une valeur ordinale, mais à dire vrai pour des nombres aussi grands, par exemple « deux millions », je pense qu’il n’est tout simplement pas d’usage de dire « l’exemplaire deux million(s?) » pour « le deux millionième exemplaire ».

L’effet des paramètres traditional, traditional o, reformed, et reformed o, est le suivant :

$\langle x \rangle$ dans “ $\langle x \rangle$ plural”	traditional	reformed	traditional o	reformed o
vingt	multiple l-last		multiple lng-last	
cent				
mil	always			
n-illion	multiple		multiple ng-last	
n-illiard				

Les configurations qui respectent les règles d’orthographe sont les suivantes :

- `\fmtcountsetoptions{french={all plural=reformed o}}` pour formater les numéraux cardinaux à valeur ordinale,
- `\fmtcountsetoptions{french={mil plural=multiple}}` pour activer l’alternance mil/mille.
- `\fmtcountsetoptions{french={all plural=reformed}}` pour revenir dans la configuration par défaut.

dash or space

```
\fmtcountsetoptions{french={dash or space=dash or space}}
```

Avant la réforme de l’orthographe de 1990, on ne met des traits d’union qu’entre les dizaines et les unités, et encore sauf quand le nombre n considéré est tel que $n \bmod 10 = 1$, dans ce cas on écrit “et un” sans trait d’union. Après la réforme de 1990, on recommande de mettre des traits d’union de partout sauf autour de “mille”, “million” et “milliard”, et les mots analogues comme “billion”, “billiard”. Cette exception a toutefois été contestée par de nombreux auteurs, et on peut aussi mettre des traits d’union de partout. Mettre l’option $\langle dash or space \rangle$ à :

traditional pour sélectionner la règle d'avant la réforme de 1990,
 1990 pour suivre la recommandation de la réforme de 1990,
 reformed pour suivre la recommandation de la dernière réforme prise en charge, actuel-
 lement l'effet est le même que 1990, ou à
 always pour mettre systématiquement des traits d'union de partout.
 Par défaut, l'option vaut `reformed`.

scale `\fmtcountsetoptions{french={scale=<scale>}}`

L'option `scale` permet de configurer l'écriture des grands nombres. Mettre `<scale>` à :

`recursive` dans ce cas 10^{30} donne mille milliards de milliards de milliards, pour 10^n , on écrit $10^{n-9 \times \max\{(n \div 9) - 1, 0\}}$ suivi de la répétition $\max\{(n \div 9) - 1, 0\}$ fois de “de milliards”
`long` $10^{6 \times n}$ donne un `<n>`illion où `<n>` est remplacé par “bi” pour 2, “tri” pour 3, etc. et $10^{6 \times n + 3}$ donne un `<n>`illiard avec la même convention pour `<n>`. L'option `long` est correcte en Europe, par contre j'ignore l'usage au Québec.
`short` $10^{6 \times n}$ donne un `<n>`illion où `<n>` est remplacé par “bi” pour 2, “tri” pour 3, etc. L'option `short` est incorrecte en Europe.
 Par défaut, l'option vaut `recursive`.

n-illiard upto `\fmtcountsetoptions{french={n-illiard upto=<n-illiard upto>}}`

Cette option n'a de sens que si `scale` vaut `long`. Certaines personnes préfèrent dire “mille `<n>`illions” qu'un “`<n>`illiard”. Mettre l'option `n-illiard upto` à :

`infinity` pour que $10^{6 \times n + 3}$ donne `<n>`illiards pour tout $n > 0$,
`infty` même effet que `infinity`,
`k` où `k` est un entier quelconque strictement positif, dans ce cas $10^{6 \times n + 3}$ donne “mille `<n>`illions” lorsque $n > k$, et donne “`<n>`illiard” sinon

mil plural mark `\fmtcountsetoptions{french={mil plural mark=<any text>}}`

La valeur par défaut de cette option est « le ». Il s'agit de la terminaison ajoutée à « mil » pour former le pluriel, c'est à dire « mille », cette option ne sert pas à grand chose sauf dans l'éventualité où ce pluriel serait francisé un jour — à dire vrai si cela se produisait une alternance mille/milles est plus vraisemblable, car « mille » est plus fréquent que « mil » et que les pluriels francisés sont formés en ajoutant « s » à la forme la plus fréquente, par exemple « blini/blinis », alors que « blini » veut dire « crêpes » (au pluriel).

4.3 Prefixes

latinnumeralstring `\latinnumeralstring{<counter>}[<prefix options>]`

latinnumeralstringnum `\latinnumeralstringnum{<number>}[<prefix options>]`

5 Configuration File `fmtcount.cfg`

You can save your preferred default settings to a file called `fmtcount.cfg`, and place it on the TeX path. These settings will then be loaded by the `fmtcount` package.

Note that if you are using the `datetime` package, the `datetime.cfg` configuration file will override the `fmtcount.cfg` configuration file. For example, if `datetime.cfg` has the line:

```
\renewcommand{\fmtord}[1]{\textsuperscript{\underline{#1}}}
```

and if `fmtcount.cfg` has the line:

```
\fmtcountsetoptions{fmtord=level}
```

then the former definition of `\fmtord` will take precedence.

6 LaTeX2HTML style

The LaTeX2HTML style file `fmtcount.perl` is provided. The following limitations apply:

- `\padzeroes` only has an effect in the preamble.
- The configuration file `fmtcount.cfg` is currently ignored. (This is because I can't work out the correct code to do this. If you know how to do this, please let me know.) You can however do:

```
\usepackage{fmtcount}  
\html{\input{fmtcount.cfg}}
```

This, I agree, is an unpleasant cludge.

7 Miscellaneous

7.1 Handling of spaces with tailing optional argument

Quite some of the commands in `fmtcount` have a tailing optional argument, notably a [*gender*] argument, which is due to historical reasons, and is a little unfortunate.

When the tailing optional argument is omitted, then any subsequent space will:

- not be gobbled if the command make some typeset output, like `\ordinal` or `\numbestring`, and
- be gobbled if the command stores a number into a label like `\storeordinalnum` or `\storenumberstring`, or make some other border effect like `\padzeroes` without any typeset output.

So (where we use visible spaces “`␣`” to demonstrate the point):

- “`x\ordinalnum{2}␣x`” will be typeset to “`x2nd␣x`”, while

- “`x\storeordinalnum{mylabel}{2}_x`” will be typeset to “xx”.

The reason for this design choice is that the commands like `\ordinal` or `\numbstring` are usually inserted in the flow of text, and one usually does not want subsequent spaces gobbled, while the commands like `\storeordinalnum` or `\storenumberstring` usually stands on their own line, and one usually does not want the tailing end-of-line to produce an extra-space.

7.2 Macro naming conventions

Macros that refer to upper-casing have upper case only in the main part of their name. That is to say the words “store”, “string” or “num” are not upper-cased for instance in `\storeORDINALstringnum`, `\storeOrdinalstringnum` or in `\NUMBERstringnum`.

Furthermore, when upper-casing all the number letters is considered, the main part of the name is:

- all in upper-case when it consist of a single word that is not composed of a prefix+radix, for instance “ORDINAL” or “NUMBER”, and
- with the prefix all in upper-case, and only the first letter of the radix in upper-case for words that consist of a prefix+radix, for instance “HEXADecimal” or “AAAlph” because they can be considered as a prefix+radix construct “hexa+decimal” or “aa+alph”.

Observance of this rule is the reason why macros `\Hexadecimal` and `\Hexadecimalnum` were respectively renamed as `\HEXADecimal` and `\HEXADecimalnum` from v3.06.

8 Acknowledgements

I would like to thank all the people who have provided translations and made bug reports.

9 Troubleshooting

There is a FAQ available at: <http://theoval.cmp.uea.ac.uk/~nlct/latex/packages/faq/>.

Bug reporting should be done via the Github issue manager at: <https://github.com/nlct/fmtcount/issues/>.

Local Variables: coding: utf-8 compile-command: "make -C ../dist fmtcount.pdf" End:

10 The Code

10.1.6 fc-french.def

Definitions for French.

```
592 \ProvidesFCLanguage{french}[2020/02/24]%
```

Package `fcprefix` is needed to format the prefix $\langle n \rangle$ in $\langle n \rangle$ illion or $\langle n \rangle$ illiard. Big numbers were developed based on reference: http://www.alain.be/boece/noms_de_nombre.html. Package `fcprefix` is now loaded by `fmtcount`.

First of all we define two macros `\fc@gl@let` and `\fc@gl@def` used in place of `\let` and `\def` within options setting macros. This way we can control from outside these macros whether the respective `\let` or `\def` is group-local or global. By default they are defined to be group-local.

```
593 \ifcsundef{fc@gl@let}{\global\let\fc@gl@let\let}{\PackageError{fmtcount}{Command already defined.}}
594 \protect\fc@gl@let\space already defined.}}
595 \ifcsundef{fc@gl@def}{\global\let\fc@gl@def\def}{\PackageError{fmtcount}{Command already defined.}}
596 \protect\fc@gl@def\space already defined.}}
```

Options for controlling plural mark. First of all we define some temporary macro `\fc@french@set@plural` in order to factorize code that defines an plural mark option:

```
#1 key name,
#2 key value,
#3 configuration index for 'reformed',
#4 configuration index for 'traditional',
#5 configuration index for 'reformed o', and
#6 configuration index for 'traditional o'.
597 \gdef\fc@french@set@plural#1#2#3#4#5#6{%
598   \ifthenelse{\equal{#2}{reformed}}{%
599     \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{#3}%
600   }{%
601     \ifthenelse{\equal{#2}{traditional}}{%
602       \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{#4}%
603     }{%
604       \ifthenelse{\equal{#2}{reformed o}}{%
605         \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{#5}%
606       }{%
607         \ifthenelse{\equal{#2}{traditional o}}{%
608           \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{#6}%
609         }{%
610           \ifthenelse{\equal{#2}{always}}{%
611             \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{0}%
612           }{%
613             \ifthenelse{\equal{#2}{never}}{%
614               \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{1}%
615             }{%
616               \ifthenelse{\equal{#2}{multiple}}{%
617                 \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{2}%
618               }{%
619                 \ifthenelse{\equal{#2}{multiple g-last}}{%
620                   \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{3}%
621                 }{%
622                   \ifthenelse{\equal{#2}{multiple l-last}}{%
623                     \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{4}%
624                   }{%
```

```

625 \ifthenelse{\equal{#2}{multiple lng-last}}{%
626 \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{5}%
627 }{%
628 \ifthenelse{\equal{#2}{multiple ng-last}}{%
629 \expandafter\fc@gl@def\csname fc@frenchoptions@#1@plural\endcsname{6}%
630 }{%
631 \PackageError{fmtcount}{Unexpected argument}{%
632 '#2' was unexpected: french option '#1 plural' expects 'reformed', 't
633 'reformed o', 'traditional o', 'always', 'never', 'multiple', 'multip
634 'multiple l-last', 'multiple lng-last', or 'multiple ng-last'.%
635 }}}}

```

Now a shorthand \@tempa is defined just to define all the options controlling plural mark. This shorthand takes into account that 'reformed' and 'traditional' have the same effect, and so do 'reformed o' and 'traditional o'.

```

636 \def\@tempa#1#2#3{%
637 \define@key{fcfrench}{#1 plural}[reformed]{%
638 \fc@french@set@plural{#1}{##1}{#2}{#3}{#3}%
639 }%

```

Macro \@tempb takes a macro as argument, and makes its current definition global. Like here it is useful when the macro name contains non-letters, and we have to resort to the \csname... \endcsname construct.

```

640 \expandafter\@tempb\csname KV@fcfrench@#1 plural\endcsname
641 }%
642 \def\@tempb#1{%
643 \global\let#1#1
644 }%
645 \@tempa{vingt}{4}{5}
646 \@tempa{cent}{4}{5}
647 \@tempa{mil}{0}{0}
648 \@tempa{n-illion}{2}{6}
649 \@tempa{n-illiard}{2}{6}

```

For option 'all plural' we cannot use the \@tempa shorthand, because 'all plural' is just a multiplexer.

```

650 \define@key{fcfrench}{all plural}[reformed]{%
651 \csname KV@fcfrench@vingt plural\endcsname{#1}%
652 \csname KV@fcfrench@cent plural\endcsname{#1}%
653 \csname KV@fcfrench@mil plural\endcsname{#1}%
654 \csname KV@fcfrench@n-illion plural\endcsname{#1}%
655 \csname KV@fcfrench@n-illiard plural\endcsname{#1}%
656 }%
657 \expandafter\@tempb\csname KV@fcfrench@all plural\endcsname

```

Now options 'dash or space', we have three possible key values:

traditional use dash for numbers below 100, except when ‘et’ is used, and space otherwise
 reformed reform of 1990, use dash except with million & milliard, and suchlikes, i.e. $\langle n \rangle$ illion and $\langle n \rangle$ illiard,
 always always use dashes to separate all words

```

658 \define@key{fcfrench}{dash or space}[reformed]{%
659   \ifthenelse{\equal{#1}{traditional}}{%
660     \let\fc@frenchoptions@supermillion@dos\space%
661     \let\fc@frenchoptions@submillion@dos\space
662   }{%
663     \ifthenelse{\equal{#1}{reformed}\or\equal{#1}{1990}}{%

687       }{%
688         \PackageError{fmtcount}{Unexpected argument}{%
689           French option ‘scale’ expects ‘long’, ‘recursive’ or ‘short’
690         }
691       }%
692     }%
693   }%
694 }%

```

Option ‘n-illiard upto’ is ignored if ‘scale’ is different from ‘long’. It can take the following values:

infinity in that case $\langle n \rangle$ illard are never disabled,
 infty this is just a shorthand for ‘infinity’, and
 n any integer that is such that $n > 0$, and that $\forall k \in \mathbb{N}, k \geq n$, number $10^{6 \times k + 3}$ will be formatted as “mille $\langle n \rangle$ illions”

```

695 \define@key{fcfrench}{n-illiard upto}[infinity]{%
696   \ifthenelse{\equal{#1}{infinity}}{%
697     \def\fc@longscale@nilliard@upto{0}%
698   }{%
699     \ifthenelse{\equal{#1}{infty}}{%
700       \def\fc@longscale@nilliard@upto{0}%
701     }{%
702       \if Q\ifnum9<1#1Q\fi\else
703         \PackageError{fmtcount}{Unexpected argument}{%
704           French option ‘milliard threshold’ expects ‘infinity’, or equivalently ‘infty’, or a no
705           integer.}%
706       \fi
707       \def\fc@longscale@nilliard@upto{#1}%
708     }%
709 }%

```

Now, the options ‘france’, ‘swiss’ and ‘belgian’ are defined to select the dialect to use. Macro \@tempa is just a local shorthand to define each one of this option.

```

710 \def\@tempa#1{%
711   \define@key{fcfrench}{#1}[]{%
712     \PackageError{fmtcount}{Unexpected argument}{French option with key ‘#1’ does not take
713     any value}}%
714   \csgdef{KV@fcfrench@#1@default}{%
715     \fc@gl@def\fmtcount@french{#1}}%
716 }%
717 \@tempa{france}\@tempa{swiss}\@tempa{belgian}%

```

Make ‘france’ the default dialect for ‘french’ language

```

718 \gdef\fmtcount@french{france}%

```

Now, option ‘dialect’ is now defined so that ‘france’, ‘swiss’ and ‘belgian’ can also be used as key values, which is more conventional although less concise.

```

719 \define@key{fcfrench}{dialect}[france]{%
720   \ifthenelse{\equal{#1}{france}
721     \or\equal{#1}{swiss}

eightiesfrench

Macro \@@eightiesfrench is used to format numbers in the interval [80..89]. Argument as follows:

#1 digit d_w such that the number to be formatted is $80 + d_w$

Implicit arguments as:

- `\count0` weight w of the number $d_{w+1}d_w$ to be formatted
- `\count1` same as `\#1`
- `\count6` input, counter giving the least weight of non zero digits in top level formatted number integral part, with rounding down to a multiple of 3,
- `\count9` input, counter giving the power type of the power of ten following the eighties to be formatted; that is '1' for "mil" and '2' for "<n>illion|<n>illiard".

`\fc@@do@plural@mark` Macro `\fc@@do@plural@mark` will expand to the plural mark of $\langle n \rangle$ illiard, $\langle n \rangle$ illion, mil, cent or vingt, whichever is applicable. First check that the macro is not yet defined.

```

1177 \ifcsundef{fc@@do@plural@mark}{}%
1178 {\PackageError{fmtcount}{Duplicate definition}{Redefinition of macro
1179   'fc@@do@plural@mark'}}

```

Arguments as follows:

#1 plural mark, 's' in general, but for mil it is `\fc@frenchoptions@mil@plural@mark`

Implicit arguments as follows:

- `\count0` input, counter giving the weight w , this is expected to be multiple of 3,
- `\count1` input, counter giving the plural value of multiplied object $\langle n \rangle$ illiard, $\langle n \rangle$ illion, mil, cent or vingt, whichever is applicable, that is to say it is 1 when the considered objet is not multiplied, and 2 or more when it is multiplied,
- `\count6` input, counter giving the least weight of non zero digits in top level formatted number integral part, with rounding down to a multiple of 3,
- `\count10` input, counter giving the plural mark control option.

```

```

#1 input, plural value of d , that is to say: let d be the number multiplying the considered power of ten, then the plural value #2 is expected to be 0 if $d = 0$, 1 if $d = 1$, or > 1 if $d > 1$

#2 output, counter, maybe 0 when power of ten is 1, 1 when power of ten starts with “mil(le)”, or 2 when power of ten is a “ $\langle n \rangle$ illion(s)| $\langle n \rangle$ illiard(s)”

#3 output, macro into which to place the formatted power of ten

Implicit arguments as follows:

`\count0` input, counter giving the weight w , this is expected to be multiple of 3

```
1245 \def\fc@pot@longscalefrench#1#2#3{%
1246   {%
```

First the input arguments are saved into local objects: #1 and #2 are respectively saved into `\@tempa` and `\@tempb`.

```
1247   \edef\@tempa{\number#1}%
```

Let `\count1` be the plural value.

```
1248   \count1=\@tempb
```

Let n and r be the quotient and remainder of division of weight w by 6, that is to say $w = n \times 6 + r$ and $0 \leq r < 6$, then `\count2` is set to n and `\count3` is set to r .

```
1249   \count2\count0 %
1250   \divide\count2 by 6 %
1251   \count3\count2 %
1252   \multiply\count3 by 6 %
1253   \count3-\count3 %
1254   \advance\count3 by \count0 %
1255   \ifnum\count0>0 %
```

If weight w (a.k.a. `\count0`) is such that $w > 0$, then $w \geq 3$ because w is a multiple of 3. So we *may* have to append “mil(le)” or “ $\langle n \rangle$ illion(s)” or “ $\langle n \rangle$ illiard(s)”.

```
1256   \ifnum\count1>0 %
```

Plural value is > 0 so have at least one “mil(le)” or “ $\langle n \rangle$ illion(s)” or “ $\langle n \rangle$ illiard(s)”. We need to distinguish between the case of “mil(le)” and that of “ $\langle n \rangle$ illion(s)” or “ $\langle n \rangle$ illiard(s)”, so we `\define \@tempb` to ‘1’ for “mil(le)”, and to ‘2’ otherwise.

```
1257   \edef\@tempb{%
1258     \ifnum\count2=0 % weight=3
```

Here $n = 0$, with $n = w \div 6$, but we also know that $w \geq 3$, so we have $w = 3$ which means we are in the “mil(le)” case.

```
1259     1%
1260   \else
1261     \ifnum\count3>2 %
```

Here we are in the case of $3 \leq r < 6$, with r the remainder of division of weight w by 6, we should have “ $\langle n \rangle$ illiard(s)”, but that may also be “mil(le)” instead depending on option ‘n-illiard upto’, known as `\fc@longscale@nilliard@upto`.

```
1262     \ifnum\fc@longscale@nilliard@upto=0 %
```

Here option ‘n-illiard upto’ is ‘infinity’, so we always use “ $\langle n \rangle$ illiard(s)”.

```
1263     2%
1264   \else
```

Here option ‘n-illiard upto’ indicate some threshold to which to compare n (a.k.a. $\backslash\text{count}2$).

`fc@muladdfrench`

Macro `\fc@muladdfrench` is used to format the sum of a number a and the product of a number d by a power of ten 10^w . Number d is made of three consecutive digits $d_{w+2}d_{w+1}d_w$ of respective weights $w+2$, $w+1$, and w , while number a is made of all digits with weight $w' > w+2$ that have already been formatted. First check that the macro is not yet defined.

```

1463 \ifcsundef{fc@muladdfrench}{}%
1464 \PackageError{fmtcount}{Duplicate definition}{Redefinition of macro
1465   'fc@muladdfrench'}}

```

Arguments as follows:

- #2 input, plural indicator for number d
- #3 input, formatted number d
- #5 input, formatted number 10^w , i.e. power of ten which is multiplied by d

Implicit arguments from context:

- `\@tempa` input, formatted number a
output, macro to which place the mul-add result
- `\count8` input, power type indicator for $10^{w'}$, where w' is a weight of a , this is an index in $[0..2]$ that reflects whether $10^{w'}$ is formatted by “mil(le)” — for index = 1 — or by “ $\langle n \rangle$ illion(s)| $\langle n \rangle$ illiard(s)” — for index = 2
- `\count9` input, power type indicator for 10^w , this is an index in $[0..2]$ that reflect whether the weight w of d is formatted by “metanothing” — for index = 0, “mil(le)” — for index = 1 — or by “ $\langle n \rangle$ illion(s)| $\langle n \rangle$ illiard(s)” — for index = 2

```

1466 \def\fc@muladdfrench#1#2#3{%
1467   {%

```

```

@@nbrstrfrench@innerCommon part of @@numberstringfrench and @@ordinalstringfrench. Arguments are as follows:

\@tempa input/output, macro to which the result is to be aggregated, initially empty or contains the sign indication.

```

1656 \def\fc@@nbrstrfrench@inner{%

```

Now loop, first we compute starting weight as $3 \times \left\lfloor \frac{\fc@max@weight}{3} \right\rfloor$ into \count0.

```

1657 \count0=\fc@max@weight
1658 \divide\count0 by 3 %
1659 \multiply\count0 by 3 %

```

Now we compute final weight into `\count5`, and round down to multiple of 3 into `\count6`.
Warning: `\count6` is an implicit input argument to macro `\fc@ltthousandstringfrench`.

```
1660 \fc@intpart@find@last{\count5 }%
1661 \count6\count5 %
1662 \divide\count6 3 %
1663 \multiply\count6 3 %
1664 \count8=0 %
1665 \loop
```

First we check whether digits in weight interval $[w..(w+2)]$ are all zero and place check result into macro `\@tempt`.

```
1666 \count1\count0 %
1667 \advance\count1 by 2 %
1668 \fc@check@nonzeros{\count0 }{\count1 }\@tempt
```

Now we generate the power of ten 10^w , formatted power of ten goes to `\@tempb`, while power type indicator goes to `\count9`.

```
1669 \fc@powerof ten \@tempt{\count9 }\@tempb
```

Now we generate the formatted number d into macro `\@tempd` by which we need to multiply 10^w . Implicit input argument is `\count9` for power type of 10^9 , and `\count6`

```
1670 \fc@ltthousandstringfrench \@tempd
```

Finally do the multiplication-addition. Implicit arguments are `\@tempa` for input/output growing formatted number, `\count8` for input previous power type, i.e. power type of 10^{w+3} , `\count9` for input current power type, i.e. power type of 10^w .

```
1671 \fc@muladdfrench \@tempt \@tempd \@tempb
```

Then iterate.

```
1672 \count8\count9 %
1673 \advance\count0 by -3 %
1674 \ifnum\count6>\count0 \else
1675 \repeat
1676 }%

10.1.8 fc-german.def

German definitions (thank you to K. H. Fricke for supplying this information)

```
1808 \ProvidesFCLanguage{german}[2018/06/17]%
```

Define macro that converts a number or count register (first argument) to an ordinal, and stores the result in the second argument, which must be a control sequence. Masculine:

```
1809 \newcommand{\@ordinalMgerman}[2]{%
1810   \edef#2{\number#1\relax.}%
1811 }%
1812 \global\let\@ordinalMgerman\@ordinalMgerman
```

Feminine:

```
1813 \newcommand{\@ordinalFgerman}[2]{%
1814   \edef#2{\number#1\relax.}%
1815 }%
1816 \global\let\@ordinalFgerman\@ordinalFgerman
```

Neuter:

```
1817 \newcommand{\@ordinalNgerman}[2]{%
1818   \edef#2{\number#1\relax.}%
1819 }%
1820 \global\let\@ordinalNgerman\@ordinalNgerman
```

Convert a number to text. The easiest way to do this is to break it up into units, tens and teens.

Units (argument must be a number from 0 to 9, 1 on its own (eins) is dealt with separately):

```
1821 \newcommand*{\@unitstringgerman}[1]{%
1822   \ifcase#1%
1823     null%
1824     \or ein%
1825     \or zwei%
1826     \or drei%
1827     \or vier%
1828     \or f"unf%
1829     \or sechs%
1830     \or sieben%
1831     \or acht%
1832     \or neun%
1833   \fi
1834 }%
1835 \global\let\@unitstringgerman\@unitstringgerman
```

Tens (argument must go from 1 to 10):

```
1836 \newcommand*{\@tenstringgerman}[1]{%
1837   \ifcase#1%
1838     \or zehn%
1839     \or zwanzig%
1840     \or drei{\ss}ig%
1841     \or vierzig%
1842     \or f"unfzig%
1843     \or sechzig%
```

```

1844 \or siebzig%
1845 \or achtzig%
1846 \or neunzig%
1847 \or einhundert%
1848 \fi
1849 }%
1850 \global\let\@@tenstringgerman\@@tenstringgerman

Portuguese definitions

```

2333 \ProvidesFCLanguage{portuges}[2017/12/26]%

```

Define macro that converts a number or count register (first argument) to an ordinal, and stores the result in the second argument, which should be a control sequence. Masculine:

```

2334 \newcommand*\@ordinalMportuges[2] {%
2335   \ifnum#1=0\relax
2336     \edef#2{\number#1}%
2337   \else
2338     \edef#2{\number#1\relax\noexpand\fmtord{o}}%
2339   \fi
2340 }%
2341 \global\let\@ordinalMportuges\@ordinalMportuges

```

Feminine:

```

2342 \newcommand*\@ordinalFportuges[2] {%
2343   \ifnum#1=0\relax
2344     \edef#2{\number#1}%
2345   \else
2346     \edef#2{\number#1\relax\noexpand\fmtord{a}}%
2347   \fi
2348 }%

```

```

2349 \global\let\@OrdinalFportuges\@OrdinalFportuges
    Make neuter same as masculine:

This has changed in version 1.09, so that it now stores the result in the second argument (a control sequence), but it doesn't display anything. Since it only affects internal macros, it shouldn't affect documents created with older versions. (These internal macros are not meant for use in documents.)

10.1.15 fc-spanish.def

Spanish definitions

```

3004 \ProvidesFCLanguage{spanish}[2016/01/12]%

```

Define macro that converts a number or count register (first argument) to an ordinal, and stores the result in the second argument, which must be a control sequence. Masculine:

```

3005 \newcommand*\@ordinalMspanish[2]{%
3006   \edef#2{\number#1\relax\noexpand\fmtord{o}}%
3007 }%
3008 \global\let\@ordinalMspanish\@ordinalMspanish

```

Feminine:

```
3009 \newcommand{\@ordinalFspanish}[2]{%
3010   \edef#2{\number#1\relax\noexpand\fmtord{a}}%
3011 }%
3012 \global\let\@ordinalFspanish\@ordinalFspanish
```

Make neuter same as masculine:

```
3013 \global\let\@ordinalNspanish\@ordinalMspanish
```

Convert a number to text. The easiest way to do this is to break it up into units, tens, teens, twenties and hundreds. Units (argument must be a number from 0 to 9):

```
3014 \newcommand*\@unitstringspanish[1]{%
3015   \ifcase#1\relax
3016     cero%
3017     \or uno%
3018     \or dos%
3019     \or tres%
3020     \or cuatro%
3021     \or cinco%
3022     \or seis%
3023     \or siete%
3024     \or ocho%
3025     \or nueve%
3026   \fi
3027 }%
3028 \global\let\@unitstringspanish\@unitstringspanish
```

Feminine:

```
3029 \newcommand*\@unitstringFspanish[1]{%
3030   \ifcase#1\relax
3031     cera%
3032     \or una%
3033     \or dos%
3034     \or tres%
3035     \or cuatro%
3036     \or cinco%
3037     \or seis%
3038     \or siete%
3039     \or ocho%
3040     \or nueve%
3041   \fi
3042 }%
3043 \global\let\@unitstringFspanish\@unitstringFspanish
```

Tens (argument must go from 1 to 10):

```
3044 \newcommand*\@tenstringspanish[1]{%
3045   \ifcase#1\relax

10.2 fcnumparser.sty

```

3800 \NeedsTeXFormat{LaTeX2e}
3801 \ProvidesPackage{fcnumparser}[2017/06/15]

```

\fc@counter@parser is just a shorthand to parse a number held in a counter.

```

3802 \def\fc@counter@parser#1{%
3803   \expandafter\fc@number@parser\expandafter{\the#1.}%
3804 }
3805 \newcount\fc@digit@counter
3806
3807 \def\fc@end@{\fc@end}

```

number@analysis First of all we need to separate the number between integer and fractional part. Number to be analysed is in '#1'. Decimal separator may be . or , whichever first. At end of this macro, integer part goes to \fc@integer@part and fractional part goes to \fc@fractional@part.

```

3808 \def\fc@number@analysis#1\fc@nil{%

```

First check for the presence of a decimal point in the number.

```

3809   \def\@tempb##1.##2\fc@nil{\def\fc@integer@part{##1}\def\@tempa{##2}}%
3810   \@tempb#1.\fc@end\fc@nil
3811   \ifx\@tempa\fc@end@

```

Here \@tempa is \ifx-equal to \fc@end, which means that the number does not contain any decimal point. So we do the same trick to search for a comma.

```

3812   \def\@tempb##1,##2\fc@nil{\def\fc@integer@part{##1}\def\@tempa{##2}}%
3813   \@tempb#1,\fc@end\fc@nil
3814   \ifx\@tempa\fc@end@

```

No comma either, so fractional part is set empty.

```

3815       \def\fc@fractional@part{}%
3816   \else

```

Comma has been found, so we just need to drop ', \fc@end' from the end of \@tempa to get the fractional part.

```

3817       \def\@tempb##1,\fc@end{\def\fc@fractional@part{##1}}%
3818       \expandafter\@tempb\@tempa
3819   \fi
3820 \else

```

Decimal point has been found, so we just need to drop '. \fc@end' from the end \@tempa to get the fractional part.

```

3821       \def\@tempb##1.\fc@end{\def\fc@fractional@part{##1}}%
3822       \expandafter\@tempb\@tempa
3823   \fi
3824 }

```

number@parser Macro \fc@number@parser is the main engine to parse a number. Argument '#1' is input and contains the number to be parsed. At end of this macro, each digit is stored separately in

a $\text{\fc@digit@}\langle n \rangle$, and macros \fc@min@weight and \fc@max@weight are set to the bounds for $\langle n \rangle$.

```
3825 \def\fc@number@parser#1{%
```

First remove all the spaces in #1, and place the result into \@tempa .

```
3826 \let\@tempa\@empty
3827 \def\@tempb##1##2\fc@nil{%
3828   \def\@tempc{##1}%
3829   \ifx\@tempc\space
3830     \else
3831       \expandafter\def\expandafter\@tempa\expandafter{\@tempa #1}%
3832     \fi
3833   \def\@tempc{##2}%
3834   \ifx\@tempc\@empty
3835     \expandafter\@gobble
3836   \else
3837     \expandafter\@tempb
3838   \fi
3839   ##2\fc@nil
3840 }%
3841 \@tempb#1\fc@nil
```

Get the sign into \fc@sign and the unsigned number part into \fc@number .

```
3842 \def\@tempb##1##2\fc@nil{\def\fc@sign{##1}\def\fc@number{##2}}%
3843 \expandafter\@tempb\@tempa\fc@nil
3844 \expandafter\if\fc@sign+%
3845   \def\fc@sign@case{1}%
3846 \else
3847   \expandafter\if\fc@sign-%
3848     \def\fc@sign@case{2}%
3849   \else
3850     \def\fc@sign{}%
3851     \def\fc@sign@case{0}%
3852     \let\fc@number\@tempa
3853   \fi
3854 \fi
3855 \ifx\fc@number\@empty
3856   \PackageError{fcnumparser}{Invalid number}{Number must contain at least one non blank
3857     character after sign}%
3858 \fi
```

Now, split \fc@number into \fc@integer@part and $\text{\fc@fractional@part}$.

```
3859 \expandafter\fc@number@analysis\fc@number\fc@nil
```

Now, split \fc@integer@part into a sequence of $\text{\fc@digit@}\langle n \rangle$ with $\langle n \rangle$ ranging from \fc@unit@weight to \fc@max@weight . We will use macro $\text{\fc@parse@integer@digits}$ for that, but that will place the digits into $\text{\fc@digit@}\langle n \rangle$ with $\langle n \rangle$ ranging from $2 \times \text{\fc@unit@weight} - \text{\fc@max@weight}$ upto $\text{\fc@unit@weight} - 1$.

```
3860 \expandafter\fc@digit@counter\fc@unit@weight
3861 \expandafter\fc@parse@integer@digits\fc@integer@part\fc@end\fc@nil
```

First we compute the weight of the most significant digit: after $\text{\fc@parse@integer@digits}$,

\fc@digit@counter is equal to $\text{\fc@unit@weight} - \text{mw} - 1$ and we want to set \fc@max@weight to $\text{\fc@unit@weight} + \text{mw}$ so we do:

$$\text{\fc@max@weight} \leftarrow (-\text{\fc@digit@counter}) + 2 \times \text{\fc@unit@weight} - 1$$

```

3862 \fc@digit@counter -\fc@digit@counter
3863 \advance\fc@digit@counter by \fc@unit@weight
3864 \advance\fc@digit@counter by \fc@unit@weight
3865 \advance\fc@digit@counter by -1 %
3866 \edef\fc@max@weight{\the\fc@digit@counter}%

```

Now we loop for $i = \text{\fc@unit@weight}$ to \fc@max@weight in order to copy all the digits from $\text{\fc@digit@}(i + \text{offset})$ to $\text{\fc@digit@}(i)$. First we compute offset into \@temp .

```

3867 {%
3868   \count0 \fc@unit@weight\relax
3869   \count1 \fc@max@weight\relax
3870   \advance\count0 by -\count1 %
3871   \advance\count0 by -1 %
3872   \def\@tempa##1{\def\@tempb{\def\@tempc{##1}}}%
3873   \expandafter\@tempa\expandafter{\the\count0}%
3874   \expandafter
3875 } \@tempb

```

Now we loop to copy the digits. To do that we define a macro \@templ for terminal recursion.

```

3876 \expandafter\fc@digit@counter\fc@unit@weight
3877 \def\@templ{%
3878   \ifnum\fc@digit@counter>\fc@max@weight
3879     \let\next\relax
3880   \else

```

Here is the loop body:

```

3881   {%
3882     \count0 \@tempc
3883     \advance\count0 by \fc@digit@counter
3884     \expandafter\def\expandafter\@tempd\expandafter{\csname fc@digit@the\count0\endcsname}
3885     \expandafter\def\expandafter\@tempe\expandafter{\csname fc@digit@the\fc@digit@counter\endcsname}
3886     \def\@tempa###1###2{\def\@tempb{\let###1###2}}%
3887     \expandafter\expandafter\expandafter\@tempa\expandafter\@tempe\@tempd
3888     \expandafter
3889     } \@tempb
3890     \advance\fc@digit@counter by 1 %
3891   \fi
3892   \next
3893 }%
3894 \let\next\@templ
3895 \@templ

```

Split $\text{\fc@fractional@part}$ into a sequence of $\text{\fc@digit@}(n)$ with $\langle n \rangle$ ranging from $\text{\fc@unit@weight} - 1$ to \fc@min@weight by step of -1 . This is much more simpler because we get the digits with the final range of index, so no post-processing loop is needed.

```

3896 \expandafter\fc@digit@counter\fc@unit@weight
3897 \expandafter\fc@parse@integer@digits\fc@fractional@part\fc@end\fc@nil

```

```

3898 \edef\fc@min@weight{\the\fc@digit@counter}%
3899 }

```

```

3968 \expandafter
3969 }\@tempb
3970 }
```

`\fc@read@thousand` Note: one myriad is ten thousand. Macro `\fc@read@myriad` is used to read a quatuor of digits and form an integer in the range [0..9999]. First we check that the macro is not yet

defined.

```
3971 \ifcsundef{fc@read@myriad}{}{%
3972   \PackageError{fncnumparser}{Duplicate definition}{Redefinition of macro
3973     'fc@read@myriad'}}}
```

Arguments as follows — same interface as `\fc@read@unit`:

- #1 output counter: into which the read value is placed
- #2 input number: unit weight at which reach the value is to be read

```
3974 \def\fc@read@myriad#1#2{%
3975   {%
3976     \fc@read@hundred{\count0}{#2}%
3977     \def\@tempa#1{\fc@read@hundred{\count1}{#1}}%
3978     \count2=#2
3979     \advance\count2 by 2
3980     \expandafter\@tempa{\the\count2}%
3981     \multiply\count1 by 100 %
3982     \advance\count1 by \count0 %
3983     \def\@tempa#1{\def\@tempb{#1=#1\relax}}%
3984     \expandafter\@tempa\expandafter{\the\count1}%
3985     \expandafter
3986   }\@tempb
3987 }
```

`\fc@check@nonzeros` Macro `\fc@check@nonzeros` is used to check whether the number represented by digits `\fc@digit@ n` , with n in some interval, is zero, one, or more than one. First we check that the macro is not yet defined.

```
3988 \ifcsundef{fc@check@nonzeros}{}{%
3989   \PackageError{fncnumparser}{Duplicate definition}{Redefinition of macro
3990     'fc@check@nonzeros'}}}
```

Arguments as follows:

- #1 input number: minimum unit unit weight at which start to search the non-zeros
- #2 input number: maximum unit weight at which end to seach the non-zeros
- #3 output macro: let n be the number represented by digits the weight of which span from #1 to #2, then #3 is set to the number $\min(n,9)$.

Actually `\fc@check@nonzeros` is just a wrapper to collect arguments, and the real job is delegated to `\fc@@check@nonzeros@inner` which is called inside a group.

```
3991 \def\fc@check@nonzeros#1#2#3{%
3992   {%
```

So first we save inputs into local macros used by `\fc@@check@nonzeros@inner` as input arguments

```
3993   \edef\@@tempa{\number#1}%
3994   \edef\@tempb{\number#2}%
3995   \count0=\@@tempa
3996   \count1=\@tempb\relax
```

Then we do the real job

```
3997   \fc@@check@nonzeros@inner
```

And finally, we propagate the output after end of group — i.e. closing brace.

```

```

`\fc@intpart@find@last` Macro `\fc@intpart@find@last` find the rightmost non zero digit in the integer part. First check that the macro is not yet defined.

```

4051 \ifcsundef\fc@intpart@find@last\{}{%
4052 \PackageError{fcnumparser}{Duplicate definition}{Redefinition of macro
4053 'fc@intpart@find@last'}}

```

When macro is called, the number of interest is already parsed, that is to say each digit of weight w is stored in macro `\fc@digit@<u>`. Macro `\fc@intpart@find@last` takes one single argument which is a counter to set to the result.

```

4054 \def\fc@intpart@find@last#1{%
4055   {%

```

Counter `\count0` will hold the result. So we will loop on `\count0`, starting from $\min\{u, w_{\min}\}$, where $u \triangleq \text{\fc@unit@weight}$, and $w_{\min} \triangleq \text{\fc@min@weight}$. So first set `\count0` to $\min\{u, w_{\min}\}$:

```

4056   \count0=\fc@unit@weight\space
4057   \ifnum\count0<\fc@min@weight\space
4058     \count0=\fc@min@weight\space
4059   \fi

```

Now the loop. This is done by defining macro `\@templ` for final recursion.

```

4060   \def\@templ{%
4061     \ifnum\csname fc@digit@the\count0\endcsname=0 %
4062       \advance\count0 by 1 %
4063       \ifnum\count0>\fc@max@weight\space
4064         \let\next\relax
4065       \fi
4066     \else
4067       \let\next\relax
4068     \fi
4069     \next
4070   }%
4071   \let\next\@templ
4072   \@templ

```

Now propagate result after closing bracket into counter #1.

```

4073     \toks0{#1}%
4074     \edef\@tempa{\the\toks0=\the\count0}%
4075     \expandafter
4076   }\@tempa\space
4077 }

```

`\fc@get@last@word` Getting last word. Arguments as follows:

- #1 input: full sequence
- #2 output macro 1: all sequence without last word
- #3 output macro 2: last word

```

4078 \ifcsundef\fc@get@last@word\PackageError{fcnumparser}{Duplicate definition}{Redefinition
4079   of macro 'fc@get@last@word'}}%
4080 \def\fc@get@last@word#1#2#3{%
4081   {%

```

First we split #1 into two parts: everything that is upto `\fc@wcase` exclusive goes to `\toks0`, and evrything from `\fc@wcase` exclusive upto the final `\@nil` exclusive goes to `\toks1`.

```

4082   \def\@tempa##1\fc@wcase##2\@nil\fc@end{%
4083     \toks0{##1}%

```

Actually a dummy `\fc@wcase` is appended to `\toks1`, because that makes easier further checking that it does not contains any other `\fc@wcase`.

```

4084     \toks1{##2\fc@wcase}%
4085   }%
4086   \@tempa#1\fc@end

```

Now leading part upto last word should be in `\toks0`, and last word should be in `\toks1`. However we need to check that this is really the last word, i.e. we need to check that there is no `\fc@wcase` inside `\toks1` other than the tailing dummy one. To that purpose we will loop while we find that `\toks1` contains some `\fc@wcase`. First we define `\@tempa` to split `\the\toks1` between parts before and after some potential `\fc@wcase`.

```

4087   \def\@tempa##1\fc@wcase##2\fc@end{%
4088     \toks2{##1}%
4089     \def\@tempb{##2}%
4090     \toks3{##2}%
4091   }%

```

`\@tempt` is just an aliases of `\toks0` to make its handling easier later on.

```

4092   \toksdef\@tempt0 %

```

Now the loop itself, this is done by terminal recursion with macro `\@templ`.

```

4093   \def\@templ{%
4094     \expandafter\@tempa\the\toks1 \fc@end
4095     \ifx\@tempb\@empty

```

`\@tempb` empty means that the only `\fc@wcase` found in `\the\toks1` is the dummy one. So we end the loop here, `\toks2` contains the last word.

```

4096     \let\next\relax
4097   \else

```

`\@tempb` is not empty, first we use

```

4098     \expandafter\expandafter\expandafter\@tempt
4099     \expandafter\expandafter\expandafter{%

```

```

4100         \expandafter\the\expandafter\@tempt
4101         \expandafter\fc@wcase\the\toks2}%
4102     \toks1\toks3 %
4103     \fi
4104     \next
4105 }%
4106 \let\next\@templ
4107 \@templ
4108 \edef\@tempa{\def\noexpand#2{\the\toks0}\def\noexpand#3{\the\toks2}}%
4109 \expandafter
4110 }\@tempa
4111 }

```

`fc@get@last@word` Getting last letter. Arguments as follows:

- #1 input: full word
- #2 output macro 1: all word without last letter
- #3 output macro 2: last letter

```

4112 \ifcsundef{fc@get@last@letter}{\PackageError{fcnumparser}{Duplicate definition}{Redefinition
4113 of macro 'fc@get@last@letter'}}%
4114 \def\fc@get@last@letter#1#2#3{%
4115   {%

```

First copy input to local `\toks1`. What we are going to do is to bubble one by one letters from `\toks1` which initially contains the whole word, into `\toks0`. At the end of the macro `\toks0` will therefore contain the whole word but the last letter, and the last letter will be in `\toks1`.

```

4116   \toks1{#1}%
4117   \toks0{}%
4118   \toksdef\@tempt0 %

```

We define `\@tempa` in order to pop the first letter from the remaining of word.

```

Stuff for calling macros. Construct `\fc@call⟨some macro⟩` can be used to pass two arguments to `⟨some macro⟩` with a configurable calling convention:

- the calling convention is such that there is one mandatory argument `⟨marg⟩` and an optional argument `⟨oarg⟩`
- either `\fc@call` is `\let` to be equal to `\fc@call@opt@arg@second`, and then calling convention is that the `⟨marg⟩` is first and `⟨oarg⟩` is second,
- or `\fc@call` is `\let` to be equal to `\fc@call@opt@arg@first`, and then calling convention is that the `⟨oarg⟩` is first and `⟨aarg⟩` is second,

- if $\langle oarg \rangle$ is absent, then it is by convention set empty,
- $\langle some\ macro \rangle$ is supposed to have two mandatory arguments of which $\langle oarg \rangle$ is passed to the first, and $\langle marg \rangle$ is passed to the second, and
- $\langle some\ macro \rangle$ is called within a group.

10.4 fmtcount.sty

This section deals with the code for `fmtcount.sty`

```

4504 \NeedsTeXFormat{LaTeX2e}
4505 \ProvidesPackage{fmtcount}[2020/01/30 v3.07]
4506 \RequirePackage{ifthen}

4507 \RequirePackage{xkeyval}
4508 \RequirePackage{etoolbox}
4509 \RequirePackage{fcprefix}

```

Need to use `\new@ifnextchar` instead of `\@ifnextchar` in commands that have a final optional argument (such as `\gls`) so require `amsgen`.

```
4510 \RequirePackage{amsgen}
```

These commands need to be defined before the configuration file is loaded.

Define the macro to format the `st`, `nd`, `rd` or `th` of an ordinal.

```
\fc@orddef@ult
```

```
4511 \providecommand*\fc@orddef@ult}[1]{\fc@textsuperscript{#1}}
```

```
c@ord@multiling
```

```
4512 \providecommand*\fc@ord@multiling}[1]{%
4513   \ifcsundef{fc@\languagenome @alias@of}{%
```

Not a supported language, just use the default setting:

```
4514   \fc@orddef@ult{#1}}{%
4515   \expandafter\let\expandafter\@tempa\csname fc@\languagenome @alias@of\endcsname
4516   \ifcsundef{fc@ord@\@tempa}{%
```

Not language specific setting, just use the default setting:

```
4517   \fc@orddef@ult{#1}}{%
```

Language with specific setting, use that setting:

```
4518 \csname fc@ord@\@tempa\endcsname{#1}}}}
```

`\padzeroes` `\padzeroes[n]`

Specifies how many digits should be displayed for commands such as `\decimal` and `\binary`.

```
4519 \newcount\c@padzeroesN
4520 \c@padzeroesN=1\relax
4521 \providecommand*\padzeroes}[1][17]{\c@padzeroesN=#1}
```

`\FCloadlang` `\FCloadlang{language}`

Load `fmtcount` language file, `fc-language.def`, unless already loaded. Unfortunately neither `babel` nor `polyglossia` keep a list of loaded dialects, so we can't load all the necessary `def` files in the preamble as we don't know which dialects the user requires. Therefore the dialect definitions get loaded when a command such as `\ordinalnum` is used, if they haven't already been loaded.

```
4522 \newcount\fc@tmpcatcode
4523 \def\fc@languages{}%
4524 \def\fc@mainlang{}%
4525 \newcommand*\FCloadlang}[1]{%
4526   \@FC@iflangloaded{#1}{}%
4527   {%
4528     \fc@tmpcatcode=\catcode'\@ \relax
4529     \catcode '@ 11\relax
4530     \InputIfFileExists{fc-#1.def}%

4535       }%
4536       {%
4537         \gappto\fc@languages{,#1}%
4538       }%
4539       \gdef\fc@mainlang{#1}%
4540     }%
4541   }%
4542   \catcode '@ \fc@tmpcatcode\relax
4543 }%
4544 }
```

`@FC@iflangloaded` `@FC@iflangloaded{language}{true}{false}`

If `fmtcount` language definition file `fc-language.def` has been loaded, do `true` otherwise do `false`

```
4545 \newcommand*\@FC@iflangloaded}[3]{%
4546   \ifcsundef{ver@fc-#1.def}{#3}{#2}%
4547 }
```

ProvidesFCLanguage Declare fmtcount language definition file. Adapted from \ProvidesFile.

```
4548 \newcommand*\ProvidesFCLanguage}[1]{%
4549   \ProvidesFile{fc-#1.def}%
4550 }
```

We need that flag to remember that a language has been loaded via package option, so that in the end we can set fmtcount in multiling

```
4551 \newif\iffmtcount@language@option
4552 \fmtcount@language@optionfalse
```

d@language@list Declare list of supported languages, as a comma separated list. No space, no empty items. Each item is a language for which fmtcount is able to load language specific definitions. Aliases but be *after* their meaning, for instance ‘american’ being an alias of ‘USenglish’, it has to appear after it in the list. The raison d’être of this list is to commonalize iteration on languages for the two following purposes:

- loading language definition as a result of the language being used by babel/polyglossia
- loading language definition as a result of package option

These two purposes cannot be handled in the same pass, we need two different passes otherwise there would be some corner cases when a package would be required — as a result of loading language definition for one language — between a \DeclareOption and a \ProcessOption which is forbidden by L^AT_EX 2_ε.

```
4553 \newcommand*\fc@supported@language@list{%
4554   english,%
4555   UKenglish,%
4556   brazilian,%
4557   british,%
4558   USenglish,%
4559   american,%
4560   spanish,%
4561   portuges,%
4562   portuguese,%
4563   french,%
4564   frenchb,%
4565   francais,%
4566   german,%
4567   germanb,%
4568   ngerman,%
4569   ngermanb,%
4570   italian}
```

ate@on@languages `\fc@iterate@on@languages{<body>}`

Now make some language iterator, note that for the following to work properly \fc@supported@language@list must not be empty. <body> is a macro that takes one argument, and \fc@iterate@on@languages applies it iteratively :

```

4571 \newcommand*\fc@iterate@on@languages[1]{%
4572   \ifx\fc@supported@language@list\@empty
      That case should never happen !
4573   \PackageError{fmtcount}{Macro ‘\protect\fc@iterate@on@languages’ is empty}{You should never
4574     Something is broken within \texttt{fmtcount}, please report the issue on
4575     \texttt{https://github.com/search?q=fmtcount\&ref=cmdform\&type=Issues}}%
4576   \else
4577     \let\fc@iterate@on@languages@body#1
4578     \expandafter\fc@iterate@on@languages\fc@supported@language@list,\@nil,%
4579   \fi
4580 }
4581 \def\fc@iterate@on@languages#1,{%
4582   {%
4583     \def\@tempa{#1}%
4584     \ifx\@tempa\@nnil
4585       \let\@tempa\@empty
4586     \else
4587       \def\@tempa{%
4588         \fc@iterate@on@languages@body{#1}%
4589         \fc@iterate@on@languages
4590       }%
4591     \fi
4592     \expandafter
4593   }\@tempa
4594 }%

```

orpolyglossialdf

```
\fc@loadifbabelorpolyglossialdf{<language>}
```

Loads fmtcount language file, `fc-⟨language⟩.def`, if one of the following condition is met:

- babel language definition file `⟨language⟩.ldf` has been loaded — conditionally to compilation with `latex`, not `xelatex`.
- polyglossia language definition file `gloss-⟨language⟩.ldf` has been loaded — conditionally to compilation with `xelatex`, not `latex`.
- `⟨language⟩` option has been passed to package `fmtcount`.

```

4595 \newcommand*\fc@loadifbabelldf[1]{\ifcsundef{ver@#1.ldf}{}\FCloadlang{#1}}
4596 \newcommand*\fc@loadifbabelorpolyglossialdf[1]{
4597   \ifpackageloaded{polyglossia}{%
4598     \def\fc@loadifbabelorpolyglossialdf#1{\IfFileExists{gloss-#1.ldf}{\ifcsundef{#1@loaded}}{\F
4599     \fc@loadifbabelldf{#1}%
4600   }%
4601 }{\ifpackageloaded{babel}{%
4602   \let\fc@loadifbabelorpolyglossialdf\fc@loadifbabelldf
4603 }{}}

```

Load appropriate language definition files:

```
4604 \fc@iterate@on@languages\fc@loadifbabelorpolyglossialdf
```

By default all languages are unique — i.e. aliases not yet defined.

```
4605 \def\fc@iterate@on@languages@body#1{%
```

```
4606   \expandafter\def\csname fc@#1@alias@of\endcsname{#1}}
```

```
4607 \expandafter\fc@iterate@on@languages\fc@supported@language@list,\@nil,%
```

Now define those languages that are aliases of another language. This is done with: `\@tempa {<alias>}{<language>}`

```
4608 \def\@tempa#1#2{%
```

```
4609   \expandafter\def\csname fc@#1@alias@of\endcsname{#2}%
```

```
4610 }%
```

```
4611 \@tempa{frenchb}{french}
```

```
4612 \@tempa{français}{french}
```

```
4613 \@tempa{germanb}{german}
```

```
4614 \@tempa{ngermanb}{german}
```

```
4615 \@tempa{ngerman}{german}
```

```
4616 \@tempa{british}{english}
```

```
4617 \@tempa{american}{USenglish}
```

Now, thanks to the aliases, we are going to define one option for each language, so that each language can have its own settings.

```
4618 \def\fc@iterate@on@languages@body#1{%
```

```
4619   \define@key{fmtcount}{#1}[]{%
```

```
4620     \FC@iflangloaded{#1}%

`\FCordinal` `\FCordinal{<number>}`

This is a bit cumbersome. Previously `\@ordinal` was defined in a similar way to `\abalph` etc. This ensured that the actual value of the counter was written in the new label stuff in the .aux file. However adding in an optional argument to determine the gender for multilingual compatibility messed things up somewhat. This was the only work around I could get to keep the the cross-referencing stuff working, which is why the optional argument comes *after* the compulsory argument, instead of the usual manner of placing it before. Note however, that putting the optional argument means that any spaces will be ignored after the command if the optional argument is omitted. Version 1.04 changed `\ordinal` to `\FCordinal` to prevent it clashing with the memoir class.

```
4904 \newcommand{\FCordinal}[1]{%
```

```
4905   \ordinalnum{%
```

```
4906     \the\value{#1}}%
```

```
4907 }
```

`\ordinal` If `\ordinal` isn't defined make `\ordinal` a synonym for `\FCordinal` to maintain compatibility with previous versions.

```
4908 \ifcsundef{ordinal}
4909 {\let\ordinal\FCordinal}%
4910 {%
4911   \PackageWarning{fmtcount}%
4912   {\protect\ordinal \space already defined use
4913    \protect\FCordinal \space instead.}
4914 }
```

`\ordinalnum` Display ordinal where value is given as a number or count register instead of a counter:

```
4915 \newrobustcmd*{\ordinalnum}[1]{%

5433     \the\value{#1}}%
5434 }
```

10.4.1 Multilingual Definitions

Flag `\fc@languagemode@detected` allows to stop scanning for multilingual mode trigger conditions. It is initialized to false as no such scanning as taken place yet.

```
5435 \newif\iffc@languagemode@detected
5436 \fc@languagemode@detectedfalse
```

`def@ultfmtcount` If multilingual support is provided, make `\@numberstring` etc use the correct language (if defined). Otherwise use English definitions. `\@setdef@ultfmtcount` sets the macros to use English.

```
5437 \def\@setdef@ultfmtcount{%
5438   \fc@languagemode@detectedtrue
5439   \ifcsundef{@ordinalMenglish}{\FCloadlang{english}}{}%
5440   \def\@ordinalstringM{\@ordinalstringMenglish}%

itling@fmtcount This defines the number and ordinal string macros to use \language:

```

5491 \def\@set@multiling@fmtcount{%
5492   \fc@languagemode@detectedtrue

```

The masculine version of \numberstring:

```

5493 \def\@numberstringM{%
5494   \fc@multiling{numberstring}{M}%
5495 }%

```

The feminine version of \numberstring:

```

5496 \def\@numberstringF{%
5497   \fc@multiling{numberstring}{F}%
5498 }%

```

The neuter version of \numberstring:

```

5499 \def\@numberstringN{%
5500   \fc@multiling{numberstring}{N}%
5501 }%

```

The masculine version of \Numberstring:

```

5502 \def\@NumberstringM{%
5503   \fc@multiling{Numberstring}{M}%
5504 }%

```

The feminine version of \Numberstring:

```

5505 \def\@NumberstringF{%

```

5506 \fc@multiling{Numberstring}{F}%
5507 }%

The neuter version of \Numberstring:

5508 \def\@NumberstringN{%
5509 \fc@multiling{Numberstring}{N}%
5510 }%

The masculine version of \ordinal:

5511 \def\@ordinalM{%
5512 \fc@multiling{ordinal}{M}%
5513 }%

The feminine version of \ordinal:

5514 \def\@ordinalF{%
5515 \fc@multiling{ordinal}{F}%
5516 }%

The neuter version of \ordinal:

5517 \def\@ordinalN{%
5518 \fc@multiling{ordinal}{N}%
5519 }%

The masculine version of \ordinalstring:

5520 \def\@ordinalstringM{%
5521 \fc@multiling{ordinalstring}{M}%
5522 }%

The feminine version of \ordinalstring:

5523 \def\@ordinalstringF{%
5524 \fc@multiling{ordinalstring}{F}%
5525 }%

The neuter version of \ordinalstring:

5526 \def\@ordinalstringN{%

5531 }%

The feminine version of \Ordinalstring:

5532 \def\@OrdinalstringF{%
5533 \fc@multiling{Ordinalstring}{F}%
5534 }%

The neuter version of \Ordinalstring:

5535 \def\@OrdinalstringN{%
5536 \fc@multiling{Ordinalstring}{N}%
5537 }%

Make `\fmtord` language dependent:

```
5538 \let\fmtord\fc@ord@multiling
5539 }
```

Check to see if `babel`, `polyglossia`, `mlp`, or `ngerman` packages have been loaded, and if yes set `fmtcount` in `multiling`. First we define some `\fc@check@for@multiling` macro to do such action where `#1` is the package name, and `#2` is a callback.

```
5540 \def\fc@check@for@multiling#1:#2\@nil{%
5541 \ifpackageloaded{#1}{%
5542 #2\@set@multiling@fmtcount
5543 }{}%
5544 }
```

Now we define `\fc@loop@on@multiling@pkg` as an iterator to scan whether any of `babel`, `polyglossia`, `mlp`, or `ngerman` packages has been loaded, and if so set multilingual mode.

```
5545 \def\fc@loop@on@multiling@pkg#1,{%
5546 \def\@tempb{#1}%
5547 \ifx\@tempb\@nnil
```

We have reached the end of the loop, so stop here.

```
5548 \let\fc@loop@on@multiling@pkg\empty
5549 \else
```

Make the `\ifpackageloaded` test and break the loop if it was positive.

```
5550 \fc@check@for@multiling#1\@nil
5551 \ifc@languagemode@detected
5552 \def\fc@loop@on@multiling@pkg##1\@nil,{}%
5553 \fi
5554 \fi
5555 \fc@loop@on@multiling@pkg
5556 }
```

Now, do the loop itself, we do this at beginning of document not to constrain the order of loading `fmtcount` and the multilingual package `babel`, `polyglossia`, etc.:

```
5557 \AtBeginDocument{%
5558 \fc@loop@on@multiling@pkg babel:,polyglossia:,ngerman:\FCloadlang{ngerman},\@nil,
```

In the case that no multilingual package (such as `babel/polyglossia/ngerman`) has been loaded, then we go to `multiling` if a language has been loaded by package option.

```
5559 \unless\ifc@languagemode@detected\iffmtcount@language@option
```

If the multilingual mode has not been yet activated, but a language option has been passed to `fmtcount`, we should go to multilingual mode. However, first of, we do some sanity check, as this may help the end user understand what is wrong: we check that macro `\language` is defined, and activate the multilingual mode only then, and otherwise fall back to default legacy mode.

```
5560 \ifcsundef{language}%
5561 {%
5562 \PackageWarning{fmtcount}{%
5563 '\protect\language' is undefined, you should use a language package such as bab
```

```

5564         when loading a language via package option. Reverting to default language.
5565     }%
5566     \@setdef@ultfmtcount
5567 }{%
5568     \@set@multiling@fmtcount
5569

```

Now, some more checking, having activated multilingual mode after a language option has been passed to `fmtcount`, we check that the `fmtcount` language definitions corresponding to `\language` have been loaded, and otherwise fall `\language` back to the latest `fmtcount` language definition loaded.

```

5570     \@FC@iflangloaded{\language}{}%

```

The current `\language` is not a `fmtcount` language that has been previously loaded. The correction is to have `\language` let to `\fc@mainlang`. Please note that, as `\iffmtcount@language@option` is true, we know that `fmtcount` has loaded some language.

```

5571     \PackageWarning{fmtcount}{%
5572         Setting ‘\protect\language’ to ‘\fc@mainlang’.\MessageBreak
5573         Reason is that ‘\protect\language’ was ‘\language’,\MessageBreak
5574         but ‘\language’ was not loaded by fmtcount,\MessageBreak
5575         whereas ‘\fc@mainlang’ was the last language loaded by fmtcount ;
5576     }%
5577     \let\language\fc@mainlang
5578 }%
5579 }%
5580 \else
5581     \@setdef@ultfmtcount
5582 \fi\fi
5583 }

```

```

5584 \AtBeginDocument{%
5585     \ifcsundef{FBsupR}{\let\fc@textsuperscript\textsuperscript}{\let\fc@textsuperscript\fc@fup}%
5586 }

```

Backwards compatibility:

```

5587 \let\@ordinal=\@ordinalM
5588 \let\@ordinalstring=\@ordinalstringM
5589 \let\@Ordinalstring=\@OrdinalstringM
5590 \let\@numberstring=\@numberstringM
5591 \let\@Numberstring=\@NumberstringM

```
