

# The **Hobby** package: code

Andrew Stacey  
[loopspace@mathforge.org](mailto:loopspace@mathforge.org)

1.8 from 2017-06-01

## 1 Implementation

### 1.1 Main Code

We use L<sup>A</sup>T<sub>E</sub>X3 syntax so need to load the requisite packages

```
1 \RequirePackage{expl3}
2 \RequirePackage{xparse}
3 \RequirePackage{pm13array}
4 \ExplSyntaxOn
5 \cs_generate_variant:Nn \fp_set:Nn {Nx}
6 \cs_generate_variant:Nn \tl_if_eq:nnTF {VnTF}
7 \cs_generate_variant:Nn \tl_if_eq:nnTF {xnTF}
```

#### 1.1.1 Initialisation

We declare all our variables.

Start with version and date, together with a check to see if we've been loaded twice (fail gracefully if so).

```
8 \tl_clear:N \l_tmpa_tl
9 \tl_if_exist:NT \g__hobby_version
10 {
11   \tl_set:Nn \l_tmpa_tl {
12     \ExplSyntaxOff
13     \tl_clear:N \l_tmpa_tl
14     \endinput
15   }
16 }
17 \tl_use:N \l_tmpa_tl
18
19 \tl_new:N \g__hobby_version
20 \tl_new:N \g__hobby_date
21 \tl_set:Nn \g__hobby_version {1.8}
22 \tl_set:Nn \g__hobby_date {2017-06-01}
23 \DeclareDocumentCommand \hobbyVersion {}
24 {
25   \tl_use:N \g__hobby_version
26 }
27 \DeclareDocumentCommand \hobbyDate {}
28 {
29   \tl_use:N \g__hobby_date
30 }
```

The function for computing the lengths of the control points depends on three parameters. These are set to  $a = \sqrt{2}$ ,  $b = 1/16$ , and  $c = \frac{3-\sqrt{5}}{2}$ .

```

31 \fp_new:N \g_hobby_parama_fp
32 \fp_new:N \g_hobby_paramb_fp
33 \fp_new:N \g_hobby_paramc_fp
34 \fp_gset:Nn \g_hobby_parama_fp {2^.5}
35 \fp_gset:Nn \g_hobby_paramb_fp {1/16}
36 \fp_gset:Nn \g_hobby_paramc_fp {(3-5^.5)/2}

```

Now we define our objects for use in generating the path.

\l\_hobby\_closed\_bool \l\_hobby\_closed\_bool is true if the path is closed.

```
37 \bool_new:N \l_hobby_closed_bool
```

(End definition for \l\_hobby\_closed\_bool. This function is documented on page ??.)

\l\_hobby\_disjoint\_bool \l\_hobby\_disjoint\_bool is true if the path should start with a `moveto` command.

```
38 \bool_new:N \l_hobby_disjoint_bool
```

(End definition for \l\_hobby\_disjoint\_bool. This function is documented on page ??.)

\l\_hobby\_save\_aux\_bool \l\_hobby\_save\_aux\_bool is true if when saving paths then they should be saved to the `aux` file.

```

39 \bool_new:N \l_hobby_save_aux_bool
40 \bool_set_true:N \l_hobby_save_aux_bool
41 \DeclareDocumentCommand \HobbyDisableAux {}
42 {
43   \bool_set_false:N \l_hobby_save_aux_bool
44 }
```

(End definition for \l\_hobby\_save\_aux\_bool. This function is documented on page ??.)

\l\_hobby\_points\_array \l\_hobby\_points\_array is an array holding the specified points on the path. In the L<sup>A</sup>T<sub>E</sub>X3 code, a “point” is a token list of the form `x = <number>, y = <number>`. This gives us the greatest flexibility in passing points back and forth between the L<sup>A</sup>T<sub>E</sub>X3 code and any calling code. The array is indexed by integers beginning with 0. In the documentation, we will use the notation  $z_k$  to refer to the  $k$ th point.

```
45 \array_new:N \l_hobby_points_array
```

(End definition for \l\_hobby\_points\_array. This function is documented on page ??.)

\l\_hobby\_points\_x\_array \l\_hobby\_points\_x\_array is an array holding the  $x$ -coordinates of the specified points.

```
46 \array_new:N \l_hobby_points_x_array
```

(End definition for \l\_hobby\_points\_x\_array. This function is documented on page ??.)

\l\_hobby\_points\_y\_array \l\_hobby\_points\_y\_array is an array holding the  $y$ -coordinates of the specified points.

```
47 \array_new:N \l_hobby_points_y_array
```

(End definition for \l\_hobby\_points\_y\_array. This function is documented on page ??.)

\l\_hobby\_actions\_array \l\_hobby\_actions\_array is an array holding the (encoded) action to be taken out on the segment of the path ending at that point.

```
48 \array_new:N \l_hobby_actions_array
```

(End definition for \l\_hobby\_actions\_array. This function is documented on page ??.)

\l\_hobby\_angles\_array \l\_hobby\_angles\_array is an array holding the angles of the lines between the points. Specifically, the angle indexed by  $k$  is the angle in radians of the line from  $z_k$  to  $z_{k+1}$ .

```
49 \array_new:N \l_hobby_angles_array
```

(End definition for \l\_hobby\_angles\_array. This function is documented on page ??.)

\_hobby\_distances\_array \l\_hobby\_distances\_array is an array holding the distances between the points. Specifically, the distance indexed by  $k$ , which we will write as  $d_k$ , is the length of the line from  $z_k$  to  $z_{k+1}$ .

```
50 \array_new:N \l_hobby_distances_array
```

(End definition for \l\_hobby\_distances\_array. This function is documented on page ??.)

hobby\_tension\_out\_array \l\_hobby\_tension\_out\_array is an array holding the tension for the path as it leaves each point. This is a parameter that controls how much the curve “flexes” as it leaves the point. In the following, this will be written  $\tau_k$ .

```
51 \array_new:N \l_hobby_tension_out_array
```

(End definition for \l\_hobby\_tension\_out\_array. This function is documented on page ??.)

hobby\_tension\_in\_array \l\_hobby\_tension\_in\_array is an array holding the tension for the path as it arrives at each point. This is a parameter that controls how much the curve “flexes” as it gets to the point. In the following, this will be written  $\bar{\tau}_k$ .

```
52 \array_new:N \l_hobby_tension_in_array
```

(End definition for \l\_hobby\_tension\_in\_array. This function is documented on page ??.)

\l\_hobby\_matrix\_a\_array \l\_hobby\_matrix\_a\_array is an array holding the subdiagonal of the linear system that has to be solved to find the angles of the control points. In the following, this will be denoted by  $A_i$ . The first index is 1.

```
53 \array_new:N \l_hobby_matrix_a_array
```

(End definition for \l\_hobby\_matrix\_a\_array. This function is documented on page ??.)

\l\_hobby\_matrix\_b\_array \l\_hobby\_matrix\_b\_array is an array holding the diagonal of the linear system that has to be solved to find the angles of the control points. In the following, this will be denoted by  $B_i$ . The first index is 0.

```
54 \array_new:N \l_hobby_matrix_b_array
```

(End definition for \l\_hobby\_matrix\_b\_array. This function is documented on page ??.)

\l\_hobby\_matrix\_c\_array \l\_hobby\_matrix\_c\_array is an array holding the superdiagonal of the linear system that has to be solved to find the angles of the control points. In the following, this will be denoted by  $C_i$ . The first index is 0.

```
55 \array_new:N \l_hobby_matrix_c_array
```

(End definition for \l\_hobby\_matrix\_c\_array. This function is documented on page ??.)

\l\_hobby\_matrix\_d\_array \l\_hobby\_matrix\_d\_array is an array holding the target vector of the linear system that has to be solved to find the angles of the control points. In the following, this will be denoted by  $D_i$ . The first index is 1.

```
56 \array_new:N \l_hobby_matrix_d_array
```

(End definition for \l\_hobby\_matrix\_d\_array. This function is documented on page ??.)

`\l_hobby_vector_u_array` `\l_hobby_vector_u_array` is an array holding the perturbation of the linear system for closed paths. The coefficient matrix for an *open* path is tridiagonal and that means that Gaussian elimination runs faster than expected ( $O(n)$  instead of  $O(n^3)$ ). The matrix for a closed path is not tridiagonal but is not far off. It can be solved by perturbing it to a tridiagonal matrix and then modifying the result. This array represents a utility vector in that perturbation. In the following, the vector will be denoted by  $u$ . The first index is 1.

```

57 \array_new:N \l_hobby_vector_u_array

```

(End definition for `\l_hobby_vector_u_array`. This function is documented on page ??.)

`\l_hobby_excess_angle_array` `\l_hobby_excess_angle_array` is an array that allows the user to say that the algorithm should add a multiple of  $2\pi$  to the angle differences. This is because these angles are wrapped to the interval  $(-\pi, \pi]$  but the wrapping might go wrong near the end points due to computation accuracy. The first index is 1.

```

58 \array_new:N \l_hobby_excess_angle_array

```

(End definition for `\l_hobby_excess_angle_array`. This function is documented on page ??.)

`\l_hobby_psi_array` `\l_hobby_psi_array` is an array holding the difference of the angles of the lines entering and exiting a point. That is,  $\psi_k$  is the angle between the lines joining  $z_k$  to  $z_{k-1}$  and  $z_{k+1}$ . The first index is 1.

```

59 \array_new:N \l_hobby_psi_array

```

(End definition for `\l_hobby_psi_array`. This function is documented on page ??.)

`\l_hobby_theta_array` `\l_hobby_theta_array` is an array holding the angles of the outgoing control points for the generated path. These are measured relative to the line joining the point to the next point on the path. The first index is 0.

```

60 \array_new:N \l_hobby_theta_array

```

(End definition for `\l_hobby_theta_array`. This function is documented on page ??.)

`\l_hobby_phi_array` `\l_hobby_phi_array` is an array holding the angles of the incoming control points for the generated path. These are measured relative to the line joining the point to the previous point on the path. The first index is 1.

```

61 \array_new:N \l_hobby_phi_array

```

(End definition for `\l_hobby_phi_array`. This function is documented on page ??.)

`\l_hobby_sigma_array` `\l_hobby_sigma_array` is an array holding the lengths of the outgoing control points for the generated path. The units are such that the length of the line to the next specified point is one unit.

```

62 \array_new:N \l_hobby_sigma_array

```

(End definition for `\l_hobby_sigma_array`. This function is documented on page ??.)

`\l_hobby_rho_array` `\l_hobby_rho_array` is an array holding the lengths of the incoming control points for the generated path. The units are such that the length of the line to the previous specified point is one unit.

```

63 \array_new:N \l_hobby_rho_array

```

(End definition for `\l_hobby_rho_array`. This function is documented on page ??.)

`\l_hobby_controla_array` `\l_hobby_controla_array` is an array holding the coordinates of the first control points on the curves. The format is the same as for `\l_hobby_points_array`.

```

64 \array_new:N \l_hobby_controla_array

```

(End definition for `\l_hobby_controla_array`. This function is documented on page ??.)

<code>\l_hobby_controlb_array</code>	<code>\l_hobby_controlb_array</code> is an array holding the coordinates of the second control points on the curves. The format is the same as for <code>\l_hobby_points_array</code> .
	65 <code>\array_new:N \l_hobby_controlb_array</code>
	<i>(End definition for <code>\l_hobby_controlb_array</code>. This function is documented on page ??.)</i>
<code>\l_hobby_matrix_v_fp</code>	<code>\l_hobby_matrix_v_fp</code> is a number which is used when doing the perturbation of the solution of the linear system for a closed curve. There is actually a vector, $v$ , that this corresponds to but that vector only has one component that needs computation.
	66 <code>\fp_new:N \l_hobby_matrix_v_fp</code>
	<i>(End definition for <code>\l_hobby_matrix_v_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_tempa_fp</code>	<code>\l_hobby_tempa_fp</code> is a temporary variable of type fp.
	67 <code>\fp_new:N \l_hobby_tempa_fp</code>
	<i>(End definition for <code>\l_hobby_tempa_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_tempb_fp</code>	<code>\l_hobby_tempb_fp</code> is a temporary variable of type fp.
	68 <code>\fp_new:N \l_hobby_tempb_fp</code>
	<i>(End definition for <code>\l_hobby_tempb_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_tempc_fp</code>	<code>\l_hobby_tempc_fp</code> is a temporary variable of type fp.
	69 <code>\fp_new:N \l_hobby_tempc_fp</code>
	<i>(End definition for <code>\l_hobby_tempc_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_tempd_fp</code>	<code>\l_hobby_tempd_fp</code> is a temporary variable of type fp.
	70 <code>\fp_new:N \l_hobby_tempd_fp</code>
	<i>(End definition for <code>\l_hobby_tempd_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_temps_fp</code>	<code>\l_hobby_temps_fp</code> is a temporary variable of type fp.
	71 <code>\fp_new:N \l_hobby_temps_fp</code>
	<i>(End definition for <code>\l_hobby_temps_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_in_curl_fp</code>	<code>\l_hobby_in_curl_fp</code> is the “curl” at the end of an open path. This is used if the angle at the end is not specified.
	72 <code>\fp_new:N \l_hobby_in_curl_fp</code>
	73 <code>\fp_set:Nn \l_hobby_in_curl_fp {1}</code>
	<i>(End definition for <code>\l_hobby_in_curl_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_out_curl_fp</code>	<code>\l_hobby_out_curl_fp</code> is the “curl” at the start of an open path. This is used if the angle at the start is not specified.
	74 <code>\fp_new:N \l_hobby_out_curl_fp</code>
	75 <code>\fp_set:Nn \l_hobby_out_curl_fp {1}</code>
	<i>(End definition for <code>\l_hobby_out_curl_fp</code>. This function is documented on page ??.)</i>
<code>\l_hobby_in_angle_fp</code>	<code>\l_hobby_in_angle_fp</code> is the angle at the end of an open path. If this is not specified, it will be computed automatically. It is set to <code>\c_inf_fp</code> to allow easy detection of when it has been specified.
	76 <code>\fp_new:N \l_hobby_in_angle_fp</code>
	77 <code>\fp_set_eq:NN \l_hobby_in_angle_fp \c_inf_fp</code>
	<i>(End definition for <code>\l_hobby_in_angle_fp</code>. This function is documented on page ??.)</i>

\l\_hobby\_out\_angle\_fp \l\_hobby\_out\_angle\_fp is the angle at the start of an open path. If this is not specified, it will be computed automatically. It is set to \c\_inf\_fp to allow easy detection of when it has been specified.

```
78 \fp_new:N \l_hobby_out_angle_fp  
79 \fp_set_eq:NN \l_hobby_out_angle_fp \c_inf_fp
```

(End definition for \l\_hobby\_out\_angle\_fp. This function is documented on page ??.)

\l\_hobby\_npoints\_int \l\_hobby\_npoints\_int is one less than the number of points on the curve. As our list of points starts at 0, this is the index of the last point. In the algorithm for a closed curve, some points are repeated whereupon this is incremented so that it is always the index of the last point.

```
80 \int_new:N \l_hobby_npoints_int
```

(End definition for \l\_hobby\_npoints\_int. This function is documented on page ??.)

\l\_hobby\_draw\_int

```
81 \int_new:N \l_hobby_draw_int
```

(End definition for \l\_hobby\_draw\_int. This function is documented on page ??.)

A “point” is a key-value list setting the x-value, the y-value, and the tensions at that point. Using keys makes it easier to pass points from the algorithm code to the calling code and vice versa without either knowing too much about the other.

```
82 \keys_define:nn {hobby / read in all} {  
83   x .fp_set:N = \l_hobby_tempa_fp,  
84   y .fp_set:N = \l_hobby_tempb_fp,  
85   tension~out .fp_set:N = \l_hobby_tempc_fp,  
86   tension~in .fp_set:N = \l_hobby_tempd_fp,  
87   excess~angle .fp_set:N = \l_hobby_temps_fp,  
88   break .tl_set:N = \l_tmpb_tl,  
89   blank .tl_set:N = \l_tmpa_tl,  
90   tension .meta:n = { tension~out=#1, tension~in=#1 },  
91   break .default:n = false,  
92   blank .default:n = false,  
93   invert~soft~blanks .choice:,  
94   invert~soft~blanks / true .code:n = {  
95     \int_gset:Nn \l_hobby_draw_int {0}  
96   },  
97   invert~soft~blanks / false .code:n = {  
98     \int_gset:Nn \l_hobby_draw_int {1}  
99   },

134   break~default .code:n = {
135     \keys_define:nn { hobby / read in all }
136     {
137       break .default:n = #1
138     }
139   },
140   blank~default .code:n = {
141     \keys_define:nn { hobby / read in all }
142     {
143       blank .default:n = #1
144     }
145   },
146   invert~soft~blanks .choice:,
147   invert~soft~blanks / true .code:n = {
148     \int_gset:Nn \l_hobby_draw_int {0}
149   },
150   invert~soft~blanks / false .code:n = {
151     \int_gset:Nn \l_hobby_draw_int {1}
152   },
153   invert~soft~blanks .default:n = true,
154 }

```

\hobby\_distangle:n Computes the distance and angle between successive points. The argument given is the index of the current point. Assumptions: the points are in \l\_hobby\_points\_x\_array and \l\_hobby\_points\_y\_array and the index of the last point is \l\_hobby\_npoints\_int.

```

155 \cs_set:Nn \hobby_distangle:n {
156   \fp_set:Nn \l_hobby_tempa_fp {
157     (\array_get:Nn \l_hobby_points_x_array {#1 + 1})
158     - (\array_get:Nn \l_hobby_points_x_array {#1})}
159
160   \fp_set:Nn \l_hobby_tempb_fp {
161     (\array_get:Nn \l_hobby_points_y_array {#1 + 1})
162     - (\array_get:Nn \l_hobby_points_y_array {#1})}
163
164   \fp_set:Nn \l_hobby_tempc_fp { atan ( \l_hobby_tempb_fp, \l_hobby_tempa_fp ) }
165   \fp_veclen:NVV \l_hobby_tempd_fp \l_hobby_tempa_fp \l_hobby_tempb_fp
166
167   \array_push:Nx \l_hobby_angles_array {\fp_to_tl:N \l_hobby_tempc_fp}

```

```

168   \array_push:Nx \l_hobby_distances_array {\fp_to_tl:N \l_hobby_tempd_fp}
169 }
```

(End definition for `\hobby_distangle:n`. This function is documented on page ??.)

`\fp_veclen:NVV` Computes the length of the vector specified by the latter two arguments, storing the answer in the first.

```

170 \cs_new:Nn \fp_veclen:Nnn {
171   \fp_set:Nn #1 {((#2)^2 + (#3)^2)^.5}
172 }
173 \cs_generate_variant:Nn \fp_veclen:Nnn {NVV}
```

(End definition for `\fp_veclen:NVV`. This function is documented on page ??.)

`\hobby_ctrllen:Nnn` Computes the length of the control point vector from the two angles, storing the answer in the first argument given.

```

174 \cs_new:Nn \hobby_ctrllen:Nnn {
175   \fp_set:Nn #1 {(2 - \g_hobby_parama_fp
176     * ( sin(#2) - \g_hobby_paramb_fp * sin(#3) )
177     * ( sin(#3) - \g_hobby_paramb_fp * sin(#2) )
178     * ( cos(#2) - cos(#3) ) )
179   / ( 1 + (1 - \g_hobby_paramc_fp) * cos(#3) + \g_hobby_paramc_fp * cos(#2)) }
180 }
181 \cs_generate_variant:Nn \hobby_ctrllen:Nnn {NVV}
```

(End definition for `\hobby_ctrllen:Nnn`. This function is documented on page ??.)

`\hobby_append_point_copy:n` This function adds a copy of the point (numbered by its argument) to the end of the list of points, copying all the relevant data (coordinates, tension, etc.).

Originally from Bruno Le Foch on TeX-SX.

```

182 \cs_new_protected:Npn \hobby_append_point_copy:n #1
183 {
184   \hobby_append_point_copy_aux:Nn \l_hobby_points_array {#1}
185   \hobby_append_point_copy_aux:Nn \l_hobby_points_x_array {#1}
186   \hobby_append_point_copy_aux:Nn \l_hobby_points_y_array {#1}
187   \hobby_append_point_copy_aux:Nn \l_hobby_tension_in_array {#1}
188   \hobby_append_point_copy_aux:Nn \l_hobby_tension_out_array {#1}
189   \hobby_append_point_copy_aux:Nn \l_hobby_excess_angle_array {#1}
190   \hobby_append_point_copy_aux:Nn \l_hobby_actions_array {#1}
191 }
192 \cs_new_protected:Npn \hobby_append_point_copy_aux:Nn #1#2
193 { \array_gpush:Nx #1 { \array_get:Nn #1 {#2} } }
```

(End definition for `\hobby_append_point_copy:n`. This function is documented on page ??.)

`\hobby_gen_path:` This is the curve generation function. We assume at the start that we have an array containing all the points that the curve must go through, and the various curve parameters have been initialised. So these must be set up by a wrapper function which then calls this one. The list of required information is:

1. `\l_hobby_points_x_array`
2. `\l_hobby_points_y_array`
3. `\l_hobby_tension_out_array`
4. `\l_hobby_tension_in_array`

```

5. \l_hobby_excess_angle_array
6. \l_hobby_in_curl_fp
7. \l_hobby_out_curl_fp
8. \l_hobby_in_angle_fp
9. \l_hobby_out_angle_fp
10. \l_hobby_closed_bool
11. \l_hobby_actions_array

194 \cs_new:Nn \hobby_gen_path:
195 {

```

For much of the time, we can pretend that a closed path is the same as an open path. To do this, we need to make the end node an internal node by repeating the  $z_1$  node as the  $z_{n+1}$ th node. We also check that the last ( $z_n$ ) and first ( $z_0$ ) nodes are the same, otherwise we repeat the  $z_0$  node as well.

```
196 \bool_if:NT \l_hobby_closed_bool {
```

Are the  $x$ -values of the first and last points different?

```

197 \fp_compare:nTF {(\array_get:Nn \l_hobby_points_x_array {0})
198     =
199     (\array_top:N \l_hobby_points_x_array)}
200 {

```

No, so compare the  $y$ -values. Are the  $y$ -values of the first and last points different?

```

201 \fp_compare:nF {
202     \array_get:Nn \l_hobby_points_y_array {0}
203     =
204     \array_top:N \l_hobby_points_y_array
205 }
206 {

```

Yes, so we need to duplicate the first point, with all of its data.

```

207 \hobby_append_point_copy:n {0}
208 }
209 }
210 {

```

Yes, so we need to duplicate the first point, with all of its data.

```

211 \hobby_append_point_copy:n {0}
212 }
```

Now that we are sure that the first and last points are identical, we need to duplicate the first-but-one point (and all of its data).

```

213 \hobby_append_point_copy:n {1}
214 }
```

Set  $\l_hobby_npoints_int$  to the number of points (minus one).

```
215 \int_gset:Nn \l_hobby_npoints_int {\array_length:N \l_hobby_points_y_array}
```

At this point, we need to decide what to do. This will depend on whether we have any intermediate points.

```
216 \int_compare:nNnTF {\l_hobby_npoints_int} = {0} {
```

Only one point, do nothing

```

217 }
218 {
219 \int_compare:nNnTF {\l_hobby_npoints_int} = {1} {

268 {
269 }
270 {

```

Got enough points, go on with processing

```

271     \hobby_compute_path:
272 }
273 \hobby_build_path:
274 }
275 }
```

(End definition for `\hobby_gen_path`. This function is documented on page ??.)

`\hobby_compute_path`: This is the path builder where we have enough points to run the algorithm.

```

276 \cs_new:Nn \hobby_compute_path:
277 {
```

Our first step is to go through the list of points and compute the distances and angles between successive points. Thus  $d_i$  is the distance from  $z_i$  to  $z_{i+1}$  and the angle is the angle of the line from  $z_i$  to  $z_{i+1}$ .

```
278 \int_step_function:nnnN {0} {1} {\l_hobby_npoints_int - 1} \hobby_distangle:n
```

For the majority of the code, we're only really interested in the differences of the angles. So for each internal point we compute the differences in the angles.

```

279 \int_step_inline:nnnn {1} {1} {\l_hobby_npoints_int - 1} {
280     \fp_set:Nx \l_hobby_tempa_fp {
281         \array_get:Nn \l_hobby_angles_array {##1}
282         - \array_get:Nn \l_hobby_angles_array {##1 - 1}}
```

We want to ensure that these angles lie in the range  $(-\pi, \pi]$ . So if the angle is bigger than  $\pi$ , we subtract  $2\pi$ . (It shouldn't be that we can get bigger than  $3\pi$  - check this.)

```

283     \fp_compare:nTF {\l_hobby_tempa_fp > \c_pi_fp} {
284     {
285         \fp_sub:Nn \l_hobby_tempa_fp {2 * \c_pi_fp}
286     }
287 }
```

Similarly, we check to see if the angle is less than  $-\pi$ .

```

288     \fp_compare:nTF {\l_hobby_tempa_fp <= -\c_pi_fp} {
289     {
290         \fp_add:Nn \l_hobby_tempa_fp {2 * \c_pi_fp}
291     }
292 }
```

The wrapping routine might not get it right at the edges so we add in the override.

```

293 \array_get:NnNTF \l_hobby_excess_angle_array {##1} \l_tmpa_t1 {
294     \fp_add:Nn \l_hobby_tempa_fp {2 * \c_pi_fp * \l_tmpa_t1}
295     }{}
```

$$296 \array_put:Nnx \l_hobby_psi_array {##1}{\fp_to_t1:N} \l_hobby_tempa_fp}$$

$$297 }$$

Next, we generate the matrix. We start with the subdiagonal. This is indexed from 1 to  $n - 1$ .

```

298 \int_step_inline:nnnn {1} {1} {\l_hobby_npoints_int - 1} {
299     \array_put:Nnx \l_hobby_matrix_a_array {##1}{\fp_to_t1:n} {
300         \array_get:Nn \l_hobby_tension_in_array {##1}^2
301         * \array_get:Nn \l_hobby_distances_array {##1}
302         * \array_get:Nn \l_hobby_tension_in_array {##1 + 1}
303     }{}}
```

Next, we attack main diagonal. We might need to adjust the first and last terms, but we'll do that in a minute.

```

305  \int_step_inline:nnnn {1} {1} {\l_hobby_npoints_int - 1} {
306
307  \array_put:Nnx \l_hobby_matrix_b_array {##1} {\fp_to_tl:n
308 {(3 * (\array_get:Nn \l_hobby_tension_in_array {##1 + 1}) - 1) *
309  (\array_get:Nn \l_hobby_tension_out_array {##1})^2 *
310  (\array_get:Nn \l_hobby_tension_out_array {##1 - 1})
311 * (\array_get:Nn \l_hobby_distances_array {##1 - 1})
312 +
313 (3 * (\array_get:Nn \l_hobby_tension_out_array {##1 - 1}) - 1)
314 * (\array_get:Nn \l_hobby_tension_in_array {##1})^2
315 * (\array_get:Nn \l_hobby_tension_in_array {##1 + 1})
316 * (\array_get:Nn \l_hobby_distances_array {##1})}
317 }
318 }
```

Next, the superdiagonal.

```

319  \int_step_inline:nnnn {1} {1} {\l_hobby_npoints_int - 2} {
320
321  \array_put:Nnx \l_hobby_matrix_c_array {##1} {\fp_to_tl:n
322 {(\array_get:Nn \l_hobby_tension_in_array {##1})^2
323 * (\array_get:Nn \l_hobby_tension_in_array {##1 - 1})
324 * (\array_get:Nn \l_hobby_distances_array {##1 - 1})
325 }}
```

```

326
327 }
328 Lastly (before the adjustments), the target vector.
329
330 \int_step_inline:nnnn {1} {1} {\l_hobby_npoints_int - 2} {
331
332 \array_put:Nnx \l_hobby_matrix_d_array {##1} {\fp_to_tl:n
333 {
334 - (\array_get:Nn \l_hobby_psi_array {##1 + 1})
335 * (\array_get:Nn \l_hobby_tension_out_array {##1})^2
336 * (\array_get:Nn \l_hobby_tension_out_array {##1 - 1})
337 * (\array_get:Nn \l_hobby_distances_array {##1 - 1})
338 - (3 * (\array_get:Nn \l_hobby_tension_out_array {##1 - 1}) - 1)
339 * (\array_get:Nn \l_hobby_psi_array {##1})
340 * (\array_get:Nn \l_hobby_tension_in_array {##1})^2
341 * (\array_get:Nn \l_hobby_tension_in_array {##1 + 1})
342 * (\array_get:Nn \l_hobby_distances_array {##1})
343 }
```

Next, there are some adjustments at the ends. These differ depending on whether the path is open or closed.

```

344 \bool_if:NTF \l_hobby_closed_bool {
Closed path
345 \array_put:Nnx \l_hobby_matrix_c_array {0} {\fp_to_tl:n {
346 - (\array_get:Nn \l_hobby_distances_array {\l_hobby_npoints_int - 2})
347 * (\array_get:Nn \l_hobby_tension_out_array {\l_hobby_npoints_int - 2})
348 * (\array_get:Nn \l_hobby_tension_out_array {\l_hobby_npoints_int - 1})^2
349 }}
```

```

352 \array_put:Nnn \l_hobby_matrix_d_array {0} {0}
353
354 \array_put:Nnx \l_hobby_matrix_b_array {\l_hobby_npoints_int - 1} {\fp_to_tl:n {
355 (\array_get:Nn \l_hobby_matrix_b_array {\l_hobby_npoints_int - 1})
356 + 1
357 } }
358
359 \array_put:Nnx \l_hobby_matrix_d_array {\l_hobby_npoints_int - 1} {\fp_to_tl:n {
360 - (\array_get:Nn \l_hobby_psi_array {1})
361 * (\array_get:Nn \l_hobby_tension_out_array {\l_hobby_npoints_int - 1})^2
362 * (\array_get:Nn \l_hobby_tension_out_array {\l_hobby_npoints_int - 2})
363 * (\array_get:Nn \l_hobby_distances_array {\l_hobby_npoints_int - 2})
364 - (3 * (\array_get:Nn \l_hobby_tension_out_array {\l_hobby_npoints_int - 2}) - 1)
365 * (\array_get:Nn \l_hobby_psi_array {\l_hobby_npoints_int - 1})
366 * (\array_get:Nn \l_hobby_tension_in_array {\l_hobby_npoints_int - 1})^2
367 * (\array_get:Nn \l_hobby_tension_in_array {\l_hobby_npoints_int})
368 * (\array_get:Nn \l_hobby_distances_array {\l_hobby_npoints_int - 1})
369 }
370 }

```

We also need to populate the  $u$ -vector

```

371 \array_put:Nnn \l_hobby_vector_u_array {0} {1}
372 \array_put:Nnn \l_hobby_vector_u_array {\l_hobby_npoints_int - 1} {1}

500   }
501
502   \array_put:Nnx \l_hobby_matrix_d_array {##1} {\fp_to_tl:n {
503     (\array_get:Nn \l_hobby_matrix_b_array {##1 - 1})
504     * (\array_get:Nn \l_hobby_matrix_d_array {##1})
505   -

```

```

506   (\array_get:Nn \l_hobby_matrix_d_array {##1 - 1})
507   * (\array_get:Nn \l_hobby_matrix_a_array {##1})
508 }}

```

On a closed path, we also want to know  $M^{-1}u$  so need to do the elimination steps on  $u$  as well.

```

509   \bool_if:NT \l_hobby_closed_bool {
510     \array_put:Nnx \l_hobby_vector_u_array {##1} {\fp_to_tl:n {
511       (\array_get:Nn \l_hobby_matrix_b_array {##1 - 1})
512       * (\array_get:Nn \l_hobby_vector_u_array {##1})
513       -
514       (\array_get:Nn \l_hobby_vector_u_array {##1 - 1})
515       * (\array_get:Nn \l_hobby_matrix_a_array {##1})
516     }})
517   }
518 }

```

Now we start the back substitution. The first step is slightly different to the general step.

```

519   \array_put:Nnx \l_hobby_theta_array {\l_hobby_npoints_int - 1} {\fp_to_tl:n {
520     (\array_get:Nn \l_hobby_matrix_d_array {\l_hobby_npoints_int - 1})
521     / (\array_get:Nn \l_hobby_matrix_b_array {\l_hobby_npoints_int - 1})
522   }})

```

For a closed path, we need to work with  $u$  as well.

```

523 \bool_if:NT \l_hobby_closed_bool {
524   \array_put:Nnx \l_hobby_vector_u_array {\l_hobby_npoints_int - 1} {\fp_to_tl:n {
525     (\array_get:Nn \l_hobby_vector_u_array {\l_hobby_npoints_int - 1})
526     / (\array_get:Nn \l_hobby_matrix_b_array {\l_hobby_npoints_int - 1})
527   }})
528 }

```

Now we iterate over the vectors, doing the remaining back substitutions.

```

529 \int_step_inline:nnnn {\l_hobby_npoints_int - 2} {-1} {0} {
530
531   \array_put:Nnx \l_hobby_theta_array {##1} {\fp_to_tl:n {
532     ( (\array_get:Nn \l_hobby_matrix_d_array {##1})
533       - (\array_get:Nn \l_hobby_theta_array {##1 + 1})
534       * (\array_get:Nn \l_hobby_matrix_c_array {##1})
535     ) / (\array_get:Nn \l_hobby_matrix_b_array {##1})
536   }})
537 }
538 \bool_if:NT \l_hobby_closed_bool {

```

On a closed path, we also need to work out  $M^{-1}u$ .

```

539 \int_step_inline:nnnn {\l_hobby_npoints_int - 2} {-1} {0} {
540   \array_put:Nnx \l_hobby_vector_u_array {##1} {\fp_to_tl:n
541   {
542     ((\array_get:Nn \l_hobby_vector_u_array {##1})
543       - (\array_get:Nn \l_hobby_vector_u_array {##1 + 1})
544       * (\array_get:Nn \l_hobby_matrix_c_array {##1})
545     ) / (\array_get:Nn \l_hobby_matrix_b_array {##1})
546   }})
547 }

```

Then we compute  $v^T M^{-1}u$  and  $v^T M^{-1}\theta$ . As  $v$  has a particularly simple form, these inner products are easy to compute.

```

548
549 \fp_set:Nn \l_hobby_tempb_fp {
550   ((\array_get:Nn \l_hobby_theta_array {1})
551   * \l_hobby_matrix_v_fp

```

```

552 - (\array_get:Nn \l_hobby_theta_array {\l_hobby_npoints_int - 1})
553 ) / (
554 (\array_get:Nn \l_hobby_vector_u_array {1})
555 * \l_hobby_matrix_v_fp
556 - (\array_get:Nn \l_hobby_vector_u_array {\l_hobby_npoints_int - 1})
557 + 1
558 )}

559 \int_step_inline:nnn {0} {1} {\l_hobby_npoints_int - 1} {

560   \array_put:Nnx \l_hobby_theta_array {##1} {\fp_to_tl:n {
561     (\array_get:Nn \l_hobby_theta_array {##1})
562     - (\array_get:Nn \l_hobby_vector_u_array {##1})
563     * \l_hobby_tempb_fp
564   })
565 }
566 }

567 }

568 }

```

Now that we have computed the  $\theta_i$ s, we can quickly compute the  $\phi_i$ s.

```

569 \int_step_inline:nnn {1} {1} {\l_hobby_npoints_int - 1} {

570   \array_put:Nnx \l_hobby_phi_array {##1} {\fp_to_tl:n {
571     - (\array_get:Nn \l_hobby_psi_array {##1})
572     - (\array_get:Nn \l_hobby_theta_array {##1})
573   })
574 }
575 }

```

If the path is open, this works for all except  $\phi_n$ . If the path is closed, we can drop our added point. Cheaply, of course.

```

576 \bool_if:NTF \l_hobby_closed_bool {
577   \int_gdecr:N \l_hobby_npoints_int
578 }

```

If  $\phi_n$  was not given, we compute it from  $\theta_{n-1}$ .

```

579 \fp_compare:nT { \l_hobby_in_angle_fp == \c_inf_fp }
580 {

## 1.2 PGF Library

The PGF level is very simple. All we do is set up the path-construction commands that get passed to the path-generation function.

```
893 \input{hobby.code.tex}
```

Points are communicated as key-pairs. These keys translate from the L<sup>A</sup>T<sub>E</sub>X3 style points to PGF points.

```

894 \pgfkeys{
895   /pgf/hobby/.is family,
896   /pgf/hobby/.cd,
897   x/.code={\pgf@x=#1cm},
898   y/.code={\pgf@y=#1cm}
899 }
```

- hobbyatan2** The original PGF version of `atan2` had the arguments the wrong way around. This was fixed in the CVS version in July 2013, but as old versions are likely to be in use for some time, we define a wrapper function that ensures that the arguments are correct.

```

900 \pgfmathparse{atan2(0,1)}
901 \def\hobby@temp{0.0}
902 \ifx\pgfmathresult\hobby@temp
903   \pgfmathdeclarefunction{hobbyatan2}{2}{%
904     \pgfmathatantwo@{\#1}{\#2}%
905 }
```

```

906 \else
907   \pgfmathdeclarefunction{hobbyatan2}{2}{%
908     \pgfmathatantwo@{\#2}{\#1}%
909   }
910 \fi

```

(End definition for `hobbyatan2`. This function is documented on page ??.)

`\hobby@curveto` This is passed to the path-generation code to translate the path into a PGF path.

```

911 \def\hobby@curveto#1#2#3{%
912   \pgfpathcurveto{\hobby@topgf{#1}}{\hobby@topgf{#2}}{\hobby@topgf{#3}}%
913 }

```

(End definition for `\hobby@curveto`. This function is documented on page ??.)

`\hobby@moveto` This is passed to the path-generation code to translate the path into a PGF path.

```

914 \def\hobby@moveto#1#2#3{%
915   \pgfpathmoveto{\hobby@topgf{#3}}%
916 }

```

(End definition for `\hobby@moveto`. This function is documented on page ??.)

`\hobby@topgf` Translates a L<sup>A</sup>T<sub>E</sub>X3 point to a PGF point.

```

917 \def\hobby@topgf#1{%
918   \pgfqkeys{/pgf/hobby}{#1}%
919 }

```

(End definition for `\hobby@topgf`. This function is documented on page ??.)

`\hobby@close` Closes a path.

```

920 \def\hobby@close#1{%
921   \pgfpathclose
922 }

```

(End definition for `\hobby@close`. This function is documented on page ??.)

`\pgfpathhobby` Low-level interface to the hobby construction. This sets up the commands and starts the iterator.

```

923 \def\pgfpathhobby{%
924   \pgfutil@ifnextchar\bgroup{\pgfpathhobby}{\pgfpathhobby{}}
925 \def\pgfpathhobby#1{%
926   \hobbyinit\hobby@moveto\hobby@curveto\hobby@close

985     \global\let\pgf@plotstreampoint=\pgf@plot@hobby@firstpt
986     \global\let\pgf@plotstreamspecial=\pgfutil@gobble
987     \gdef\pgf@plotstreamend{%
988       \ifhobby@externalise
989         \ifx\hobby@path@name\pgfutil@empty
990           \hobbygenusepath
991         \else
992           \hobbygenuseifnecpath{\hobby@path@name}%
993         \fi
994       \else
995         \hobbygenusepath
996       \fi
997       \ifx\hobby@path@name\pgfutil@empty
998       \else
999         \hobbySAVEpath{\hobby@path@name}%
1000       \fi
1001       \global\let\hobby@path@name=\pgfutil@empty
1002     }%
1003   }
1004 }
```

(End definition for `\pgfplotshandlerclosedhobby`. This function is documented on page ??.)

`\pgf@plot@hobby@firstpt` First point, move or line as appropriate and then start the algorithm.

```

1005 \def\pgf@plot@hobby@firstpt#1{%
1006   \pgf@plot@first@action{#1}%
1007   \pgf@plot@hobby@handler{#1}%
1008   \global\let\pgf@plotstreampoint=\pgf@plot@hobby@handler
1009 }
```

(End definition for `\pgf@plot@hobby@firstpt`. This function is documented on page ??.)

`\pgf@plot@hobby@handler` Add points to the array for the algorithm to work on.

```

1010 \def\pgf@plot@hobby@handler#1{%
1011   #1%
1012   \pgfmathsetmacro\hobby@x{\the\pgf@x/1cm}%
1013   \pgfmathsetmacro\hobby@y{\the\pgf@y/1cm}%
1014   \hobbyaddpoint{x = \hobby@x, y = \hobby@y}%
1015 }
```

(End definition for `\pgf@plot@hobby@handler`. This function is documented on page ??.)

`\pgfplotshandlerquickhobby` Uses the “quick” algorithm.

```

1016 \def\pgfplotshandlerquickhobby{%
1017   \def\pgf@plotstreamstart{%
1018     \global\let\hobby@quick@curveto=\pgfpathcurveto
1019     \global\let\pgf@plotstreampoint=\pgf@plot@qhobby@firstpt
1020     \global\let\pgf@plotstreamspecial=\pgfutil@gobble
1021     \global\let\pgf@plotstreamend=\pgf@plot@qhobby@end
1022   }
1023 }
```

(End definition for `\pgfplot@qhobby@firstpt`. This function is documented on page ??.)

`\pgfplot@qhobby@firstpt` Carry out first action (move or line) and save point.

```
1024 \def\pgfplot@qhobby@firstpt#1{%
1025   #1%
1026   \edef\hobby@temp{\noexpand\pgfplot@first@action{\noexpand\pgfqpoint{\the\pgf@x}{\the\pgf@y}}}\hobby
1027   \xdef\hobby@qpoints{\noexpand\pgfqpoint{\the\pgf@x}{\the\pgf@y}}%
1028   \gdef\hobby@qpointa{}%
1029   \gdef\hobby@angle{}%
1030   \global\let\pgfplotstreampoint=\pgfplot@qhobby@secondpt
1031 }
```

(End definition for `\pgfplot@qhobby@firstpt`. This function is documented on page ??.)

`\pgfplot@qhobby@secondpt` Also need to save second point.

```
1032 \def\pgfplot@qhobby@secondpt#1{%
1033   #1%
1034   \xdef\hobby@qpointa{\noexpand\pgfqpoint{\the\pgf@x}{\the\pgf@y}}%
1035   \global\let\pgfplotstreampoint=\pgfplot@qhobby@handler
1036 }
```

(End definition for `\pgfplot@qhobby@secondpt`. This function is documented on page ??.)

`\pgfplot@qhobby@handler` Wrapper around the computation macro that saves the variables globally.

```
1037 \def\pgfplot@qhobby@handler#1{%
1038   #1%
1039   \edef\hobby@temp{\noexpand\hobby@quick@compute{\noexpand\pgfqpoint{\the\pgf@x}{\the\pgf@y}}}\hobby@t
1040   \global\let\hobby@qpointa=\hobby@qpointa
1041   \global\let\hobby@qpoints=\hobby@qpoints
1042   \global\let\hobby@angle=\hobby@angle
```

Also need to save some data for the last point

```
1043 \global\let\hobby@thetaone=\hobby@thetaone
1044 \global\let\hobby@phitwo=\hobby@phitwo
1045 \global\let\hobby@done=\hobby@done
1046 \global\let\hobby@omegaone=\hobby@omegaone
1047 }
```

(End definition for `\pgfplot@qhobby@handler`. This function is documented on page ??.)

`\pgfplot@qhobby@end` Wrapper around the finalisation step.

```
1048 \def\pgfplot@qhobby@end{%
1049   \hobby@quick@computeend
1050 }
```

(End definition for `\pgfplot@qhobby@end`. This function is documented on page ??.)

`\hobby@sf` Working with points leads to computations out of range so we scale to get them into the computable arena.

```
1051 \pgfmathsetmacro\hobby@sf{10cm}
```

(End definition for `\hobby@sf`. This function is documented on page ??.)

`\hobby@quick@compute` This is the macro that does all the work of computing the control points. The argument is the current point, `\hobby@qpointa` is the middle point, and `\hobby@qpoints` is the first point.

```
1052 \def\hobby@quick@compute#1{%
```

Save the current (second - counting from zero) point in `\pgf@xb` and `\pgf@yb`.

```
1053 #1%
1054 \pgf@xb=\pgf@x
1055 \pgf@yb=\pgf@y
```

Save the previous (first) point in `\pgf@xa` and `\pgf@ya`.

```
1056 \hobby@qpointa  
1057 \pgf@xa=\pgf@x  
1058 \pgf@ya=\pgf@y
```

Adjust so that  $(\text{\pgf@xb}, \text{\pgf@yb})$  is the vector from second to third. Then compute and store the distance and angle of this vector. We view this as the vector *from* the midpoint and everything to do with that point has the suffix **one**. Note that we divide by the scale factor here.

```
1059 \advance\pgf@xb by -\pgf@xa  
1060 \advance\pgf@yb by -\pgf@ya  
1061 \pgfmathsetmacro{\hobby@done}{sqrt((\pgf@xb/\hobby@sf)^2 + (\pgf@yb/\hobby@sf)^2)}%  
1062 \pgfmathsetmacro{\hobby@omegalone}{rad(hobbyatan2(\pgf@yb,\pgf@xb))}%
```

Now we do the same with the vector from the zeroth to the first point

```
1063 \hobby@qpoints  
1064 \advance\pgf@xa by -\pgf@x  
1065 \advance\pgf@ya by -\pgf@y  
1066 \pgfmathsetmacro{\hobby@dzero}{sqrt((\pgf@xa/\hobby@sf)^2 + (\pgf@ya/\hobby@sf)^2)}%  
1067 \pgfmathsetmacro{\hobby@omegazero}{rad(hobbyatan2(\pgf@ya,\pgf@xa))}%
```

\hobby@psi is the angle subtended at the midpoint. We adjust to ensure that it is in the right range.

```
1068 \pgfmathsetmacro{\hobby@psi}{\hobby@omegaone - \hobby@omegazero}%
1069 \pgfmathsetmacro{\hobby@psi}{\hobby@psi > pi ? \hobby@psi - 2*pi : \hobby@psi}%
1070 \pgfmathsetmacro{\hobby@psi}{\hobby@psi < -pi ? \hobby@psi + 2*pi : \hobby@psi}%
```

Now we test to see if we're on the first run or not. If the first, we have no incoming angle.

1071 \ifx\hobby@angle\pgfutil@empty

First.

```
1072 \pgfmathsetmacro{\hobby@thetaone}{-\hobby@psi * \hobby@done%  
1073 /(\hobby@done + \hobby@dzero)}%  
1074 \pgfmathsetmacro{\hobby@thetazero}{-\hobby@psi - \hobby@thetaone}%  
1075 \let\hobby@phione=\hobby@thetazero  
1076 \let\hobby@phitwo=\hobby@thetaone  
1077 \else
```

Second or later.

```

1078 \let\hobby@thetazero=\hobby@angle
1079 \pgfmathsetmacro\hobby@thetaone{%
1080 -(2 * \hobby@psi + \hobby@thetazero) * \hobby@done%
1081 / (2 * \hobby@done + \hobby@dzero)}%
1082 \pgfmathsetmacro\hobby@phione{ -\hobby@psi - \hobby@thetaone}%
1083 \let\hobby@phitwo=\hobby@thetaone
1084 \fi

```

Save the outgoing angle.

```
1085 \let\hobby@angle=\hobby@thetaone
```

Compute the control points from the angles.

Now call the call-back function

```
1087 \edef\hobby@temp{\noexpand\hobby@quick@curveto{\noexpand\pgfqpoint{\the\pgf@xa}{\the\pgf@ya}}{\noexp-  
1088 \hobby@temp}
```

Cycle the points round for the next iteration.

```
1089 \global\let\hobby@qpoints=\hobby@qpointa
1090 #1
1091 \xdef\hobby@qpointa{\noexpand\pgfpoint{\the\pgf@x}{\the\pgf@y}}%
```

Save needed values in global macros

```
1092 \global\let\hobby@angle=\hobby@angle
1093 \global\let\hobby@phitwo=\hobby@phitwo
1094 \global\let\hobby@thetaone=\hobby@thetaone
1095 \global\let\hobby@done=\hobby@done
1096 \global\let\hobby@omegaone=\hobby@omegaone
1097 }
```

(End definition for `\hobby@quick@compute`. This function is documented on page ??.)

`\hobby@wwick@computeend` This is the additional code for the final run.

```
1098 \def\hobby@quick@computeend{%
```

Compute the control points for the second part of the curve and add that to the path.

```
1099 \hobby@quick@ctrlpts{\hobby@thetaone}{\hobby@phitwo}{\hobby@qpoints}{\hobby@qpointa}{\hobby@done}{\hobby@omegaone}
```

Now call the call-back function

```
1100 \edef\hobby@temp{\noexpand\hobby@quick@curveto{\noexpand\pgfpoint{\the\pgf@xa}{\the\pgf@ya}}{\noexpand
1101 \hobby@temp
1102 }%
```

(End definition for `\hobby@wwick@computeend`. This function is documented on page ??.)

`\hobby@quick@ctrlpts` Compute the control points from the angles and points given.

```

There is a “spare hook” in the TikZ path processing code. If TikZ encounters a path of the form  $(0,0) \dots (1,1)$  then it calls a macro `\tikz@curveto@auto`. However, that macro is not defined in the TikZ code. The following code provides a suitable definition. To play nice, we don’t install it by default but define a key (defined above) that installs it.

`\hobby@curveto@override`

```
1378 \def\hobby@curveto@override{%
1379   \hobby@curveto@delegate}
```

(End definition for `\hobby@curveto@override`. This function is documented on page ??.)

`\hobby@curveto@auto` When we’re called by TikZ, we initialise the path generation code and start adding points. To ensure that the generation code is called, we add a lot of hooks to lots of TikZ commands.

```
1380 \def\hobby@curveto@auto{%

`quick curve through` The `quick curve through` is a to path which does the “quick” version of Hobby’s algorithm. The syntax is as with the `curve through`: to pass the midpoints as the argument to the style. We need to pass three points to the auxiliary macro. These are passed as `\hobby@qpoints`, `\hobby@qpointa`, and the current point. Then these get cycled round for the next triple. The path gets built up and stored as `\hobby@quick@path`. We also have to remember the angle computed for the next round.

```

## 1.4 Arrays

A lot of our data structures are really arrays. These are implemented as L<sup>A</sup>T<sub>E</sub>X3 “property lists”. For ease of use, an array is a property list with numeric entries together with entries “base” and “top” which hold the lowest and highest indices that have been set.

```
1702 \RequirePackage{expl3}
1703 \ExplSyntaxOn
```

Some auxiliary variables.

```
1704 \tl_new:N \l_array_tmp_tl
1705 \tl_new:N \l_array_show_tl
1706 \int_new:N \l_array_base_int
1707 \int_new:N \l_array_top_int
1708 \int_new:N \l_array_tmp_int
```

The global variable `\g_array_base_int` says what index a blank array should start with when pushed or unshifted.

```
1709 \int_new:N \g_array_base_int
1710 \int_set:Nn \g_array_base_int {0}
```

`\array_adjust_ends:Nn` This ensures that the “base” and “top” are big enough to include the given index.

```
1711 \cs_new:Npn \array_adjust_ends:Nn #1#2 {
1712   \prop_get:NnNTF #1 {base} \l_tmpa_tl
1713   {
1714     \int_compare:nNnTF {\l_tmpa_tl} > {#2}
1715     {
1716       \prop_put:Nnx #1 {base} {\int_eval:n {#2}}
1717     }
1718   }
1719   {
1720     \prop_put:Nnx #1 {base} {\int_eval:n {#2}}
1721   }
1722   \prop_get:NnNTF #1 {top} \l_tmpa_tl
1723   {
1724     \int_compare:nNnTF {\l_tmpa_tl} < {#2}
1725     {
1726       \prop_put:Nnx #1 {top} {\int_eval:n {#2}}
1727     }
1728   }
1729   {
1730     \prop_put:Nnx #1 {top} {\int_eval:n {#2}}
1731   }
1732 }
1733 }
```

(End definition for `\array_adjust_ends:Nn`. This function is documented on page ??.)

`\array_gadjust_ends:Nn` This ensures that the “base” and “top” are big enough to include the given index. (Global version)

```
1735 \cs_new:Npn \array_gadjust_ends:Nn #1#2 {

For displaying arrays, we need some messages.

1856 \msg_new:nnn { kernel } { show-array }
1857 {
1858   The~array~\token_to_str:N #1~
1859   \array_if_empty:NTF #1
1860   { is~empty }
1861   { contains~the~items~(without~outer~braces): }
1862 }

\array_show:N Mapping through an array isn't expandable so we have to set a token list to its contents first before
passing it to the message handler.

1863 \cs_new_protected:Npn \array_show:N #1
1864 {
1865   \__msg_show_variable>NNNnn
